8th KIAS workshop on particle physics and cosmology
November 2nd, 2018

Evidences for Dark Matter

Several observations indicate the existence of non-luminous Dark Matter (missing force) at very different scales!

- * Galactic rotation curves
- * RC in Clusters of galaxies
- * Clusters of galaxies
- * CMB anisotropies

Evidences for Dark Matter

Several observations indicate the existence of non-luminous Dark Matter (missing force) at very different scales!

- * Galactic rotation curves
- * RC in Clusters of galaxies
- * Clusters of galaxies
- * CMB anisotropies

Dark Matter is there! :-)

But what is it? :-/

- * Neutral
- * Massive enough
- * ‘Weak’ interactions
- * Stable or long-lived

*Dark Matter needs
New Physics beyond the Standard Model!*

Hai-Bo Yu

Core-vs-cusp problem

THINGS (dwarf galaxy survey) - Oh et al. (2011)

Too-big-to-fail problem

Small-scale problems → Self-interacting DM

Small-scale problems:

- * Core-vs-cusp
- * Too-big-to-fail

Possible solutions:

- * Baryonic physics
 - Can't use DM-only simulations to model real DM+baryon Universe
 - Astrophysical observations not being modeled correctly
(Suppressed gas cooling efficiency, low star-formation efficiency, supernova feedback, large velocity anisotropy...)
- * *Dark Matter*
DM may not be collisionless

Small-scale problems → Self-interacting DM

Small-scale problems:

- * Core-vs-cusp
- * Too-big-to-fail

Possible solutions:

- * Baryonic physics
 - Can't use DM-only simulations to model real DM+baryon Universe
 - Astrophysical observations not being modeled correctly
(Suppressed gas cooling efficiency, low star-formation efficiency, supernova feedback, large velocity anisotropy...)
- * *Dark Matter*
DM may not be collisionless

$$\left(\frac{\sigma_{\text{scatter}}}{m_\chi} \right)_{\text{obs}} = (0.1 - 10) \text{ cm}^2/\text{g} \quad \sim \text{few barns/GeV}$$

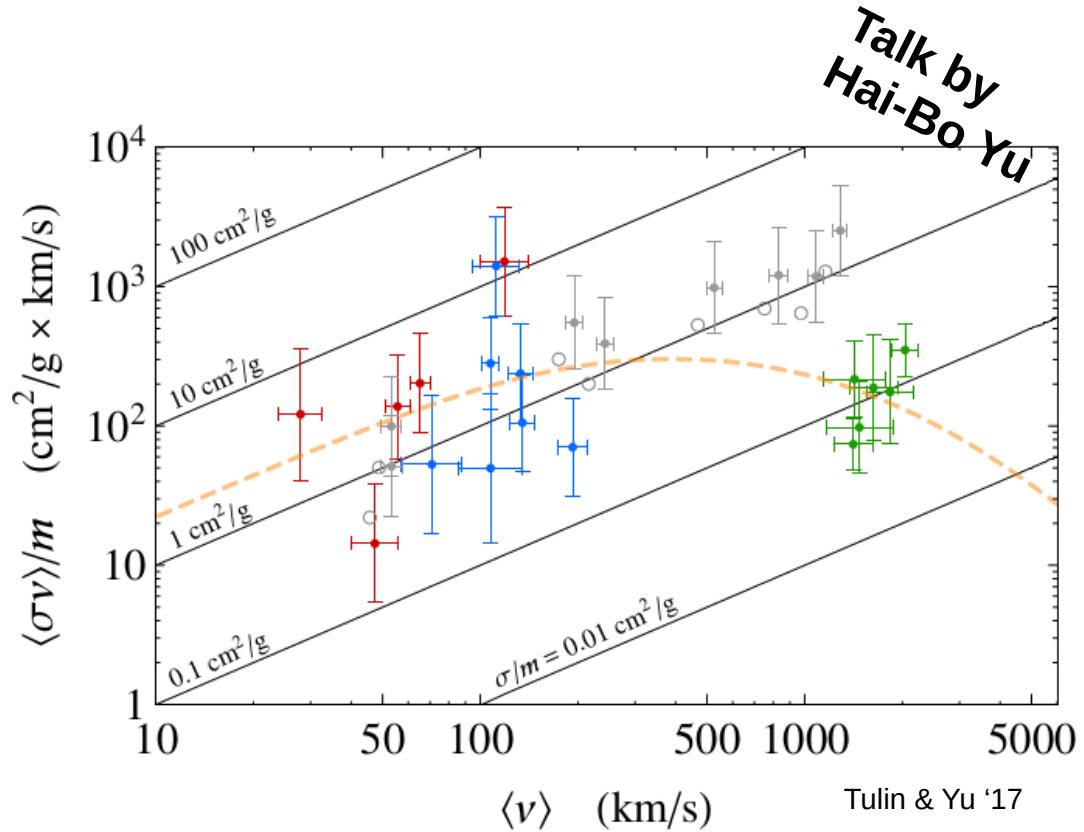

$$\frac{\sigma_{\text{scatter}}}{m_X} \lesssim 1 \text{ cm}^2/\text{g}.$$

From the Bullet Cluster

Small-scale problems → Self-interacting DM

However, observations tend to favor velocity dependent cross-sections:

- * Light mediator
- * Resonance

Small-scale problems → Self-interacting DM

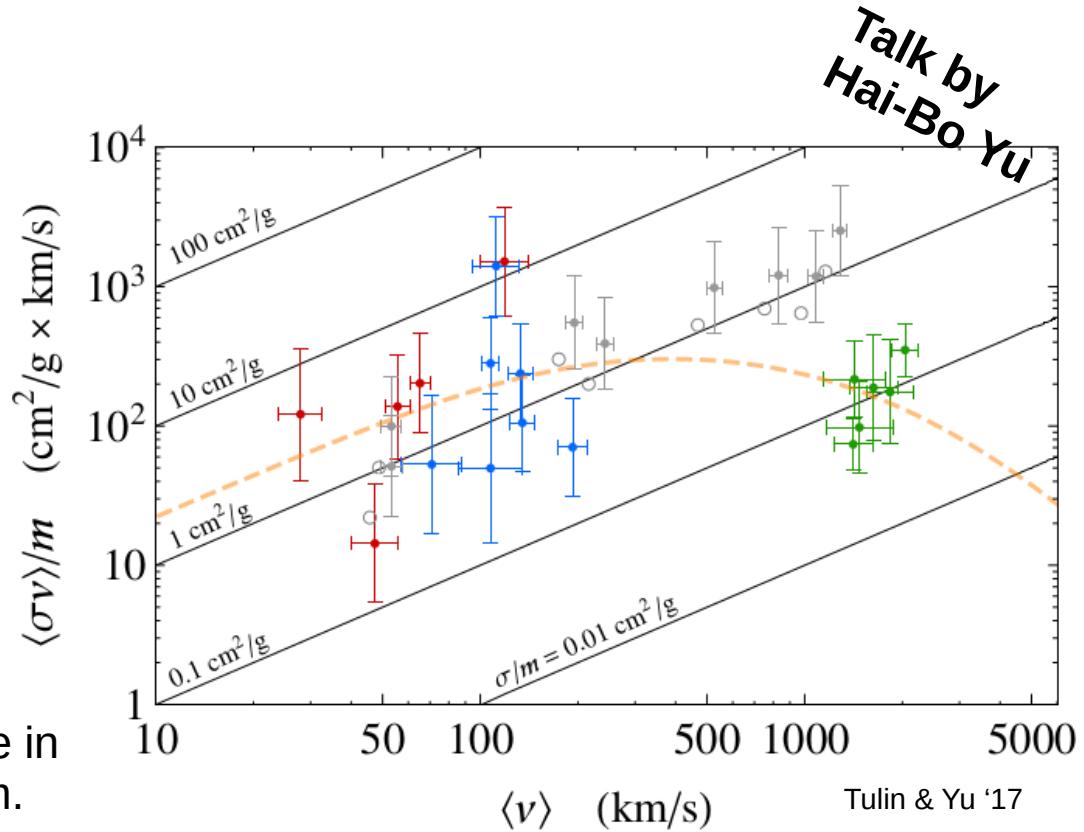

However, observations tend to favor velocity dependent cross-sections:

- * Light mediator
- * Resonance

My personal view:

I'm completely *agnostic* about DM playing a role in the solution of the small-scale structure problem.

Let's make this an opportunity to explore regions of the parameter space largely overlooked!

The SIMPlest DM model ever: Singlet Scalar Dark Matter

Singlet Scalar DM

McDonald '07

S is a real singlet scalar, protected by a Z_2

$$V = \mu_S^2 S^2 + \lambda_S S^4 + \lambda_{HS} |H|^2 S^2$$

3 free parameters:

- * m_S DM mass
- * λ_{HS} Higgs portal
- * λ_S DM quartic coupling

Singlet Scalar DM

McDonald '07

S is a real singlet scalar, protected by a Z_2

$$V = \mu_S^2 S^2 + \lambda_S S^4 + \lambda_{HS} |H|^2 S^2$$

3 free parameters:

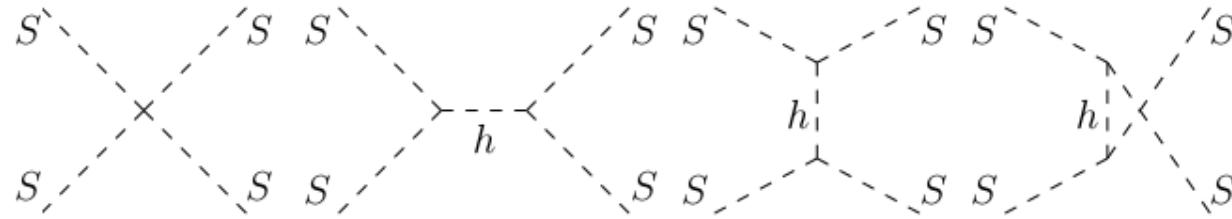

- * m_S DM mass
- * λ_{HS} Higgs portal
- * λ_S DM quartic coupling

}

← Concentrated on this

← ~ Ignored!

Dark Matter Self-interactions

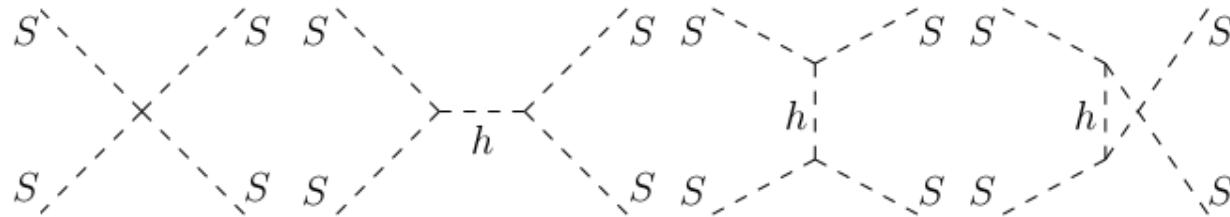

$$\frac{\sigma_{SS}}{m_S} \sim \frac{9}{8\pi} \frac{\lambda_S^2}{m_S^3}$$

$$\frac{\sigma_{SS}}{m_S} \sim O(1) \text{ cm}^2/\text{g}$$

Implies $\left\{ \begin{array}{l} {}^*\lambda_s \sim 1 \\ {}^*m_s \sim 100 \text{ MeV} \end{array} \right.$

Dark Matter Self-interactions & Invisible Higgs decay

$$\frac{\sigma_{SS}}{m_S} \sim \frac{9}{8\pi} \frac{\lambda_S^2}{m_S^3}$$

$$\frac{\sigma_{SS}}{m_S} \sim O(1) \text{ cm}^2/\text{g}$$

Implies $\left\{ \begin{array}{l} {}^*\lambda_S \sim 1 \\ {}^*m_S \sim 100 \text{ MeV} \end{array} \right.$

The Higgs tends to annihilate into DM
 $\text{BR}(h \rightarrow \text{inv.}) < 20\%$

$${}^*\lambda_{HS} < 10^{-3}$$

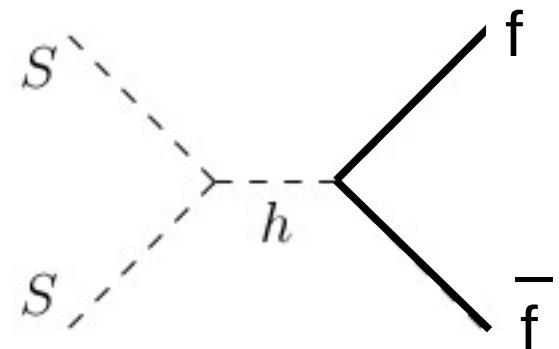

How to produce such a Self-interacting Dark Matter?

WIMP DM :-/

DM can (only) annihilate into light fermions
other annihilation channels kinematically closed!

$$\langle \sigma_{SS \rightarrow f\bar{f}} v \rangle \sim \frac{\lambda_{HS}^2}{\pi} \frac{m_f^2}{m_h^4}$$

$$\langle \sigma_{SS \rightarrow f\bar{f}} v \rangle \ll 10^{-26} \text{ cm}^3/\text{s}$$

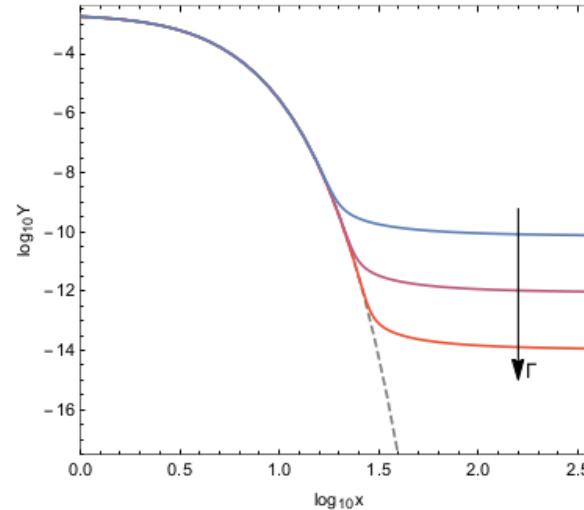

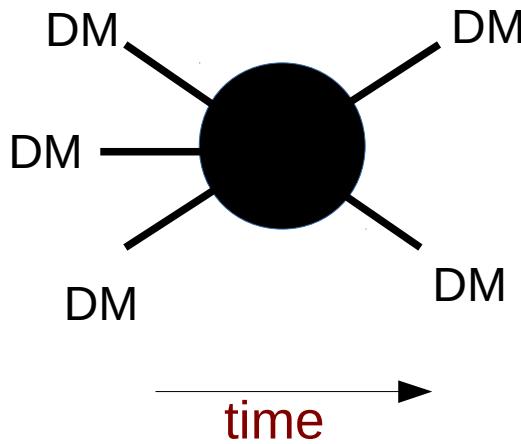

- Universe overclosed
- SSDM with sizable self-interactions can not be a WIMP

**Again:
How to produce such a
Self-Interacting Dark Matter?**

SIMP DM $3 \rightarrow 2$ annihilations

Hochberg, Kuflik, Volansky & Wacker '14

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^2 \rangle_{3 \rightarrow 2} (n^3 - n^2 n_{\text{eq}})$$

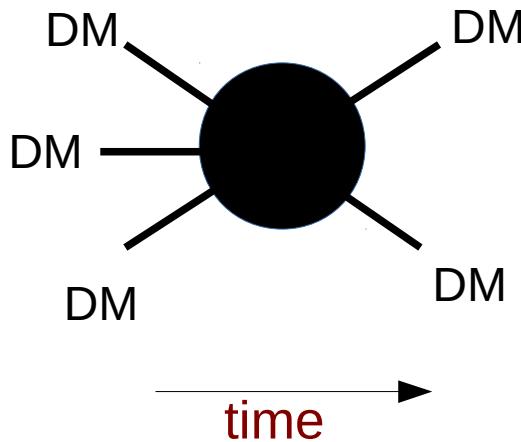

SIMP DM

$3 \rightarrow 2$ annihilations

Hochberg, Kuflik, Volansky & Wacker '14

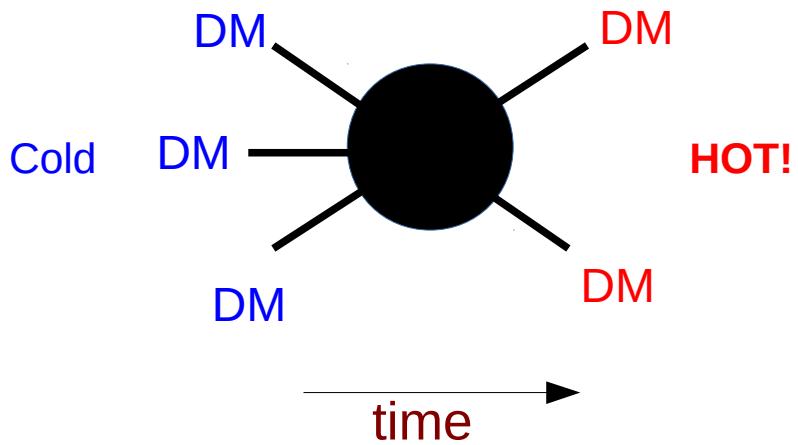

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^2 \rangle_{3 \rightarrow 2} (n^3 - n^2 n_{\text{eq}})$$

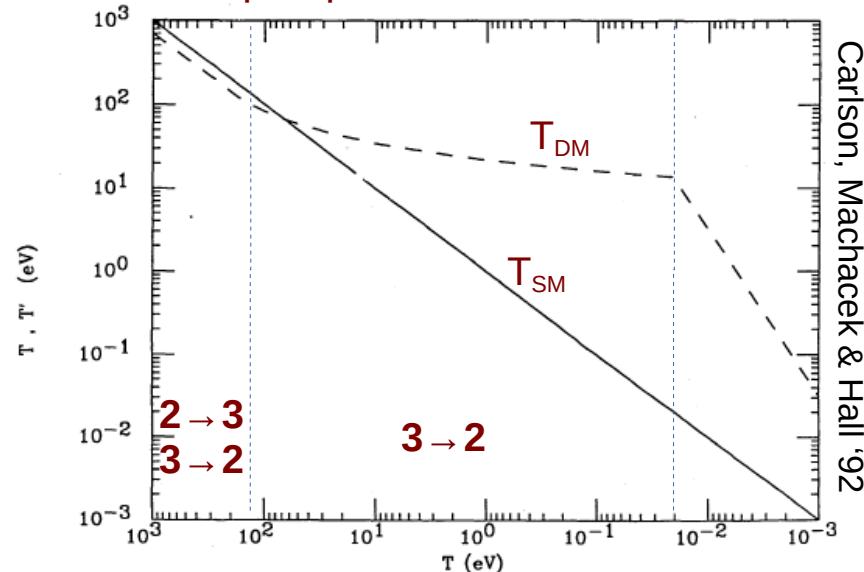

- * DM in the MeV range
- * Suppressed DM-SM portal λ_{HS}
- * $\lambda_s \sim 1$
‘Strong’ Self-interactions
→ SIMP DM

SIMP DM $3 \rightarrow 2$ annihilations

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^2 \rangle_{3 \rightarrow 2} (n^3 - n^2 n_{\text{eq}})$$

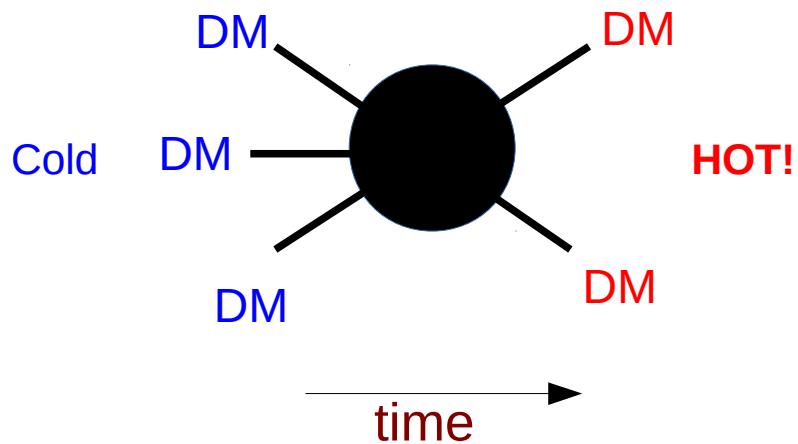

Caveat: $3 \rightarrow 2$ annihilations
pump heat into the dark sector!

SIMP DM

$3 \rightarrow 2$ annihilations

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^2 \rangle_{3 \rightarrow 2} (n^3 - n^2 n_{\text{eq}})$$

Caveat: $3 \rightarrow 2$ annihilations
pump heat into the dark sector!

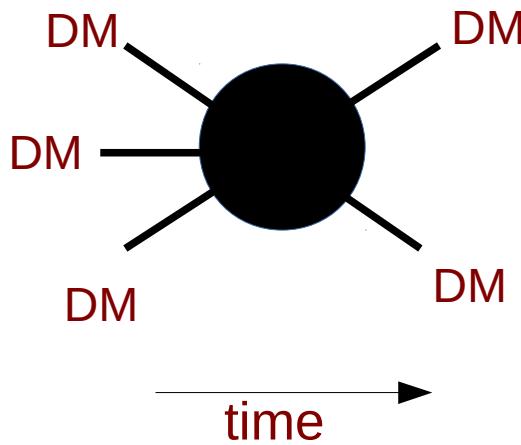

Solutions:

- * kinetic equilibrium between SM and DM
- * Extended dark sector
with relativistic particles at DM FO
- * DM and SM always out of kinetic equilibrium
à la freeze-in

SIMP DM

$3 \rightarrow 2$ annihilations

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^2 \rangle_{3 \rightarrow 2} (n^3 - n^2 n_{\text{eq}})$$

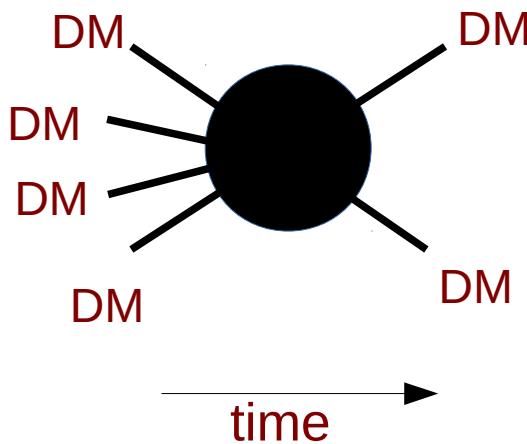

$3 \rightarrow 2$ reactions are forbidden in most common scenarios, where the DM stability is guaranteed by a Z_2 symmetry
(R -parity in SUSY, K -parity in Kaluza-Klein...)

SIMP DM

$4 \rightarrow 2$ annihilations

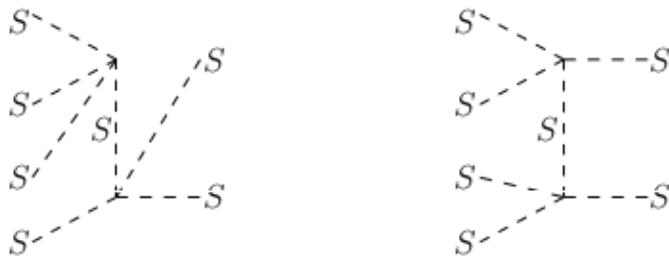

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^3 \rangle_{4 \rightarrow 2} (n^4 - n^2 n_{\text{eq}}^2)$$

$3 \rightarrow 2$ reactions are forbidden in most common scenarios, where the DM stability is guaranteed by a Z_2 symmetry (R -parity in SUSY, K -parity in Kaluza-Klein...)
But Z_2 symmetries allow $4 \rightarrow 2$ annihilations!

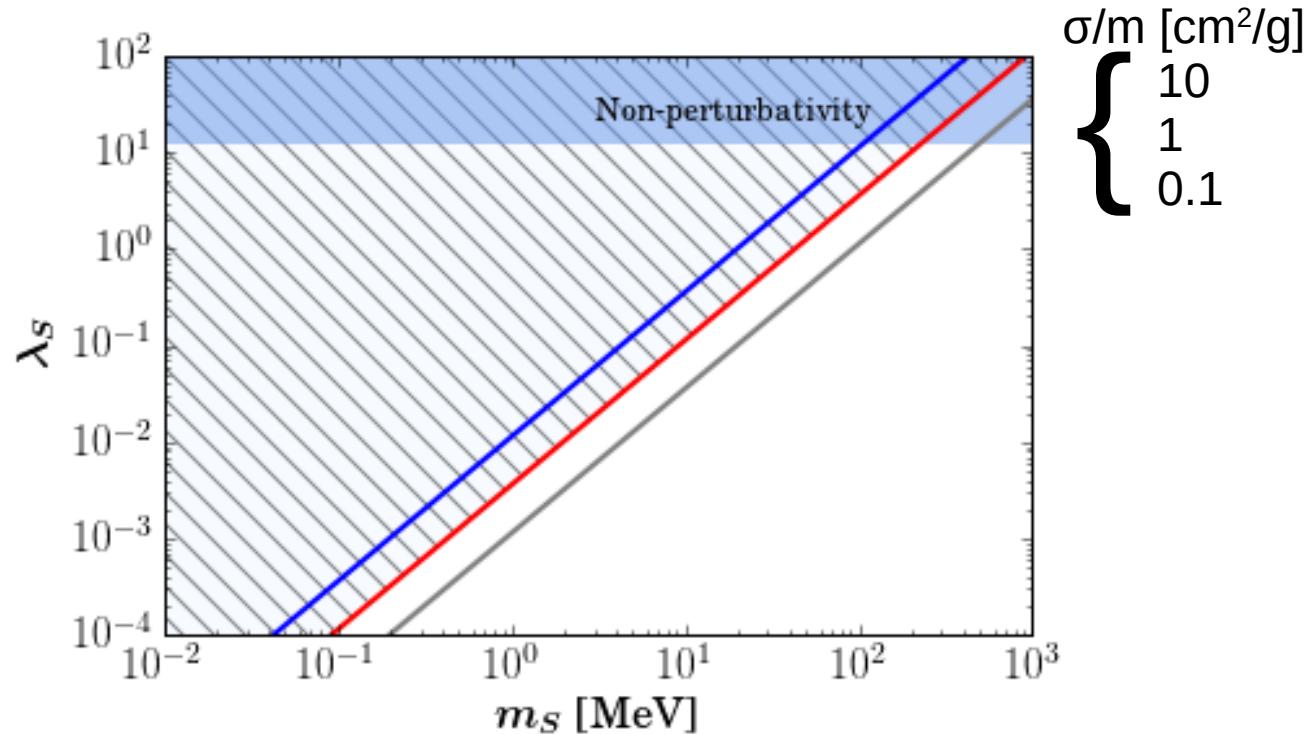

Singlet Scalar DM $4 \rightarrow 2$ annihilations

$$\frac{dn}{dt} + 3Hn = -\langle\sigma v^3\rangle_{4\rightarrow2} (n^4 - n^2 n_{\text{eq}}^2)$$

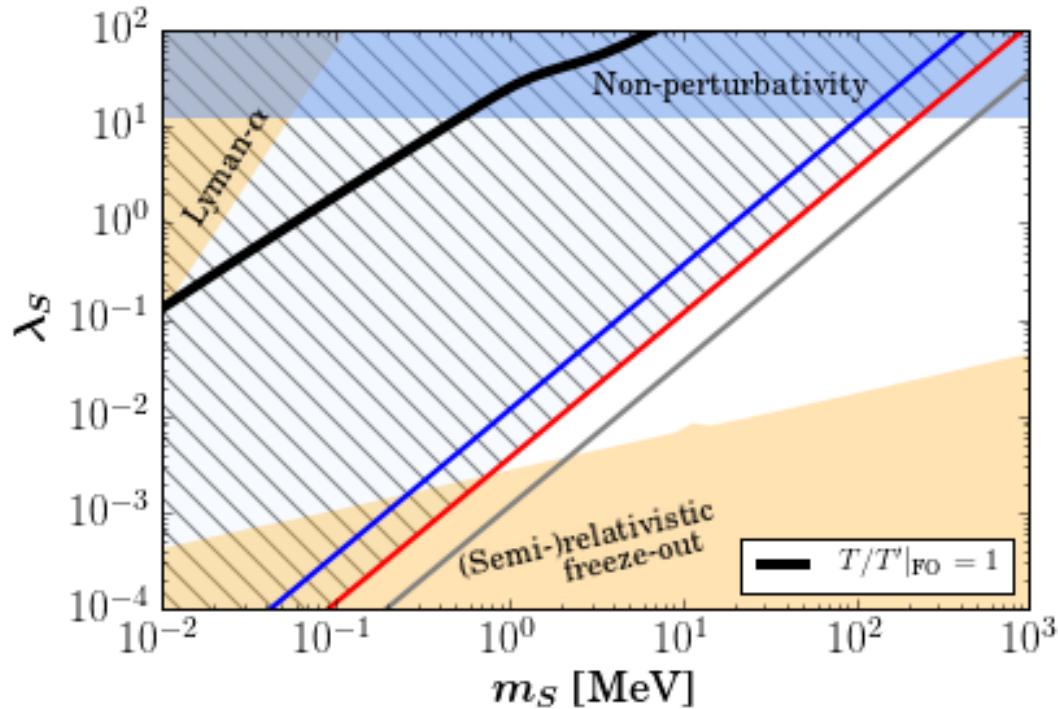

$$\langle\sigma v^3\rangle_{4\rightarrow2} \sim \frac{27\sqrt{3}}{8\pi} \frac{\lambda_S^4}{m_S^8}$$

Singlet Scalar DM $4 \rightarrow 2$ annihilations

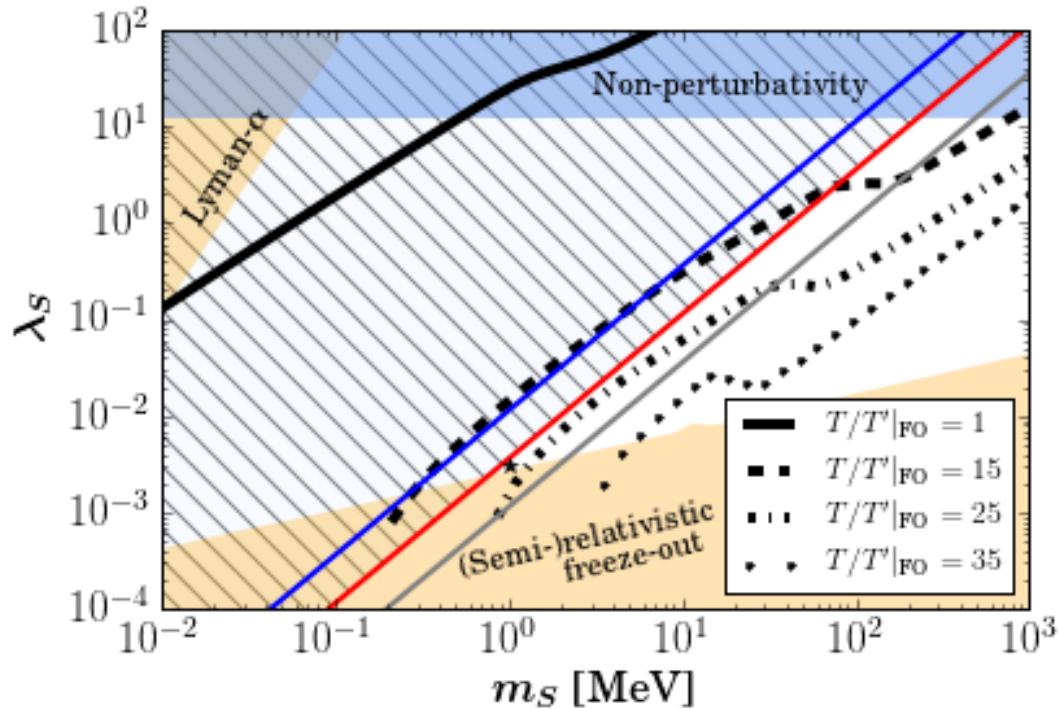

Singlet Scalar DM $4 \rightarrow 2$ annihilations

$T_{\text{SM}} = T_{\text{DM}}$ @ DM freeze-out

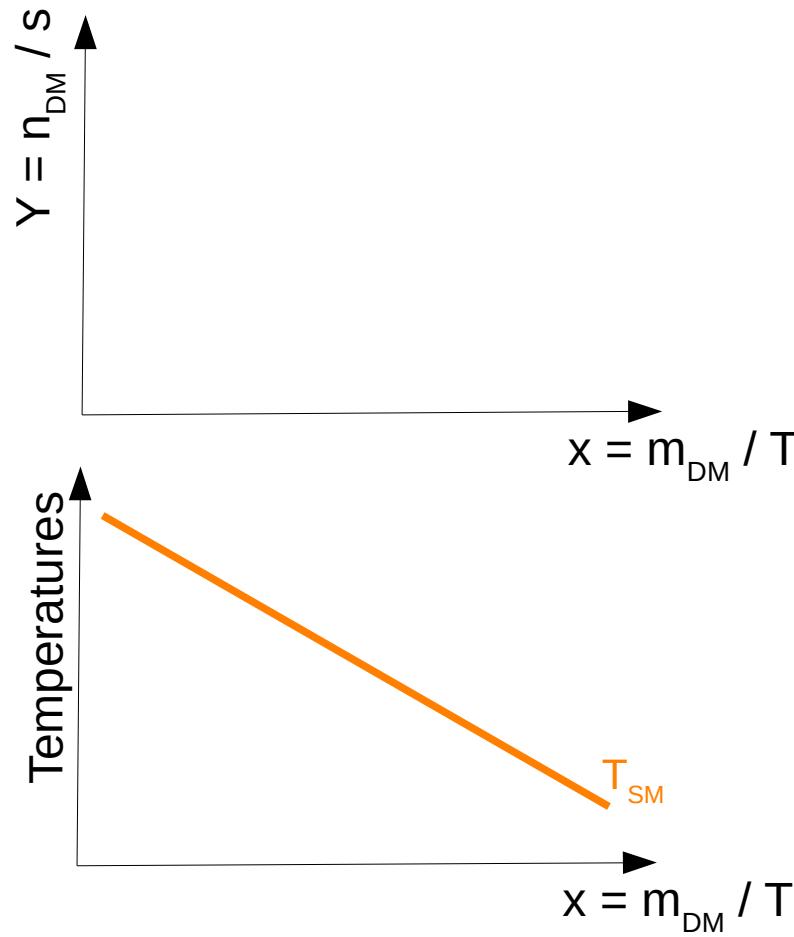

Singlet Scalar DM $4 \rightarrow 2$ annihilations

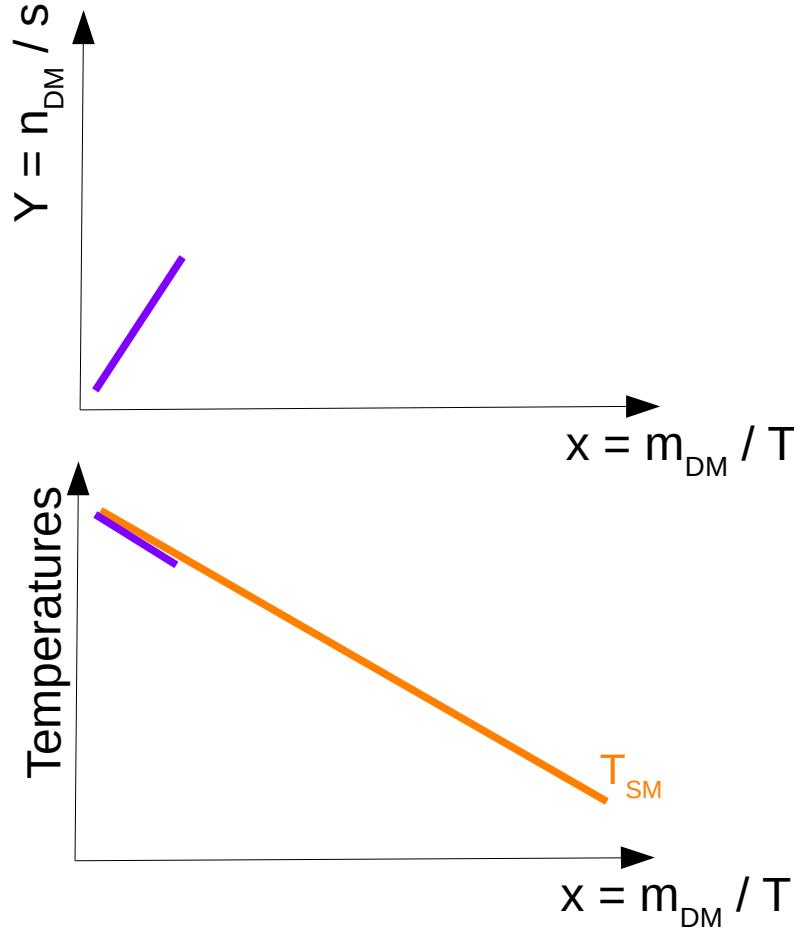

$T_{SM} = T_{DM}$
&
 $T_{SM} \neq T_{DM}$ @ DM freeze-out

How to dynamically produce such a difference of temperatures?

(Non-) Thermal evolution of DM

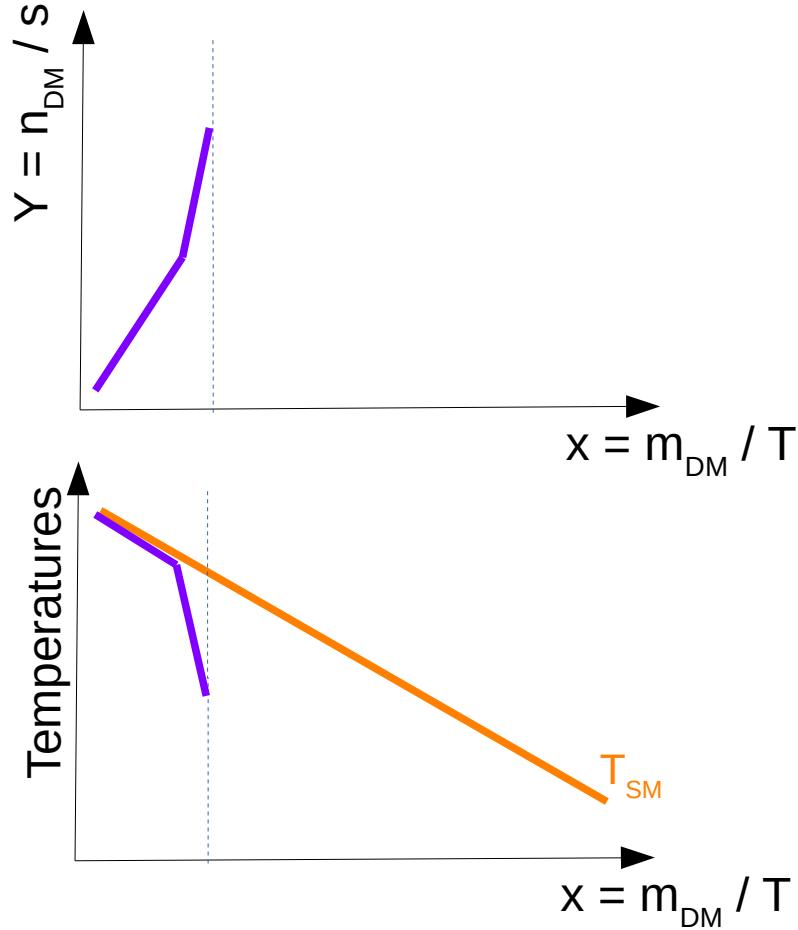

(Non-) Thermal evolution of DM

DM Production
* Out-of-equilibrium production à la freeze-in: $h \rightarrow SS$
DM in kinetic equilibrium via $2 \leftrightarrow 2$
DM inherits SM temperature

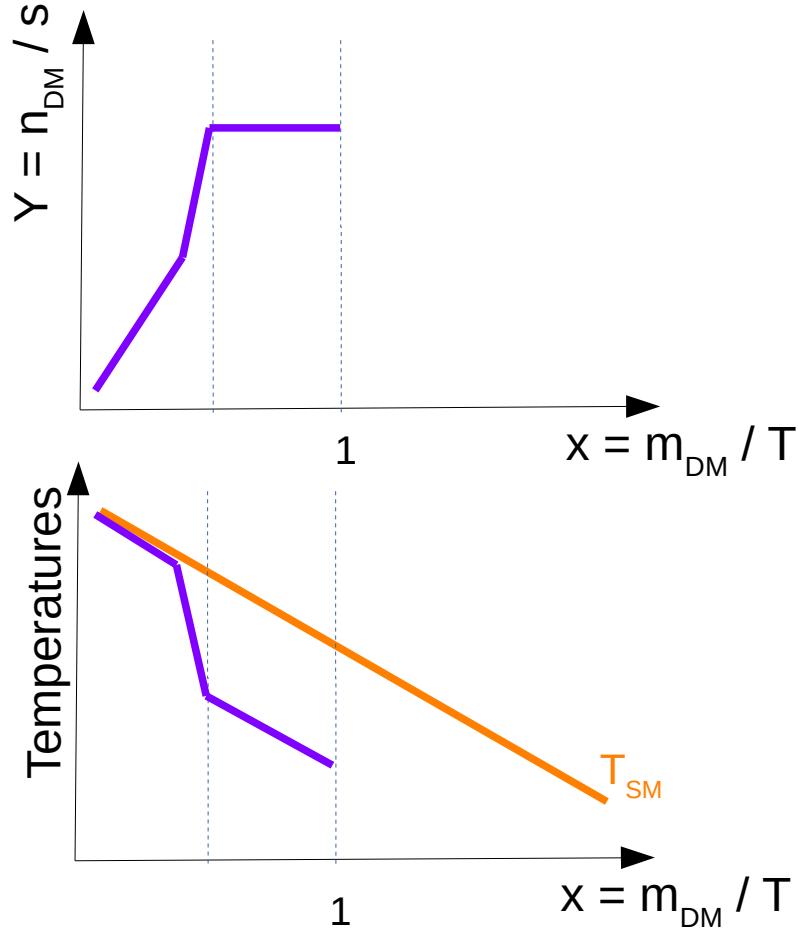

(Non-) Thermal evolution of DM

DM Production

- * Out-of-equilibrium production à la freeze-in: $h \rightarrow SS$
DM in kinetic equilibrium via $\mathbf{2} \leftrightarrow \mathbf{2}$
DM inherits SM temperature
- * DM populates rapidly via out-of-equilibrium $\mathbf{2} \rightarrow \mathbf{4}$.
Price to pay: Dramatic decrease of T_{DM}

(Non-) Thermal evolution of DM

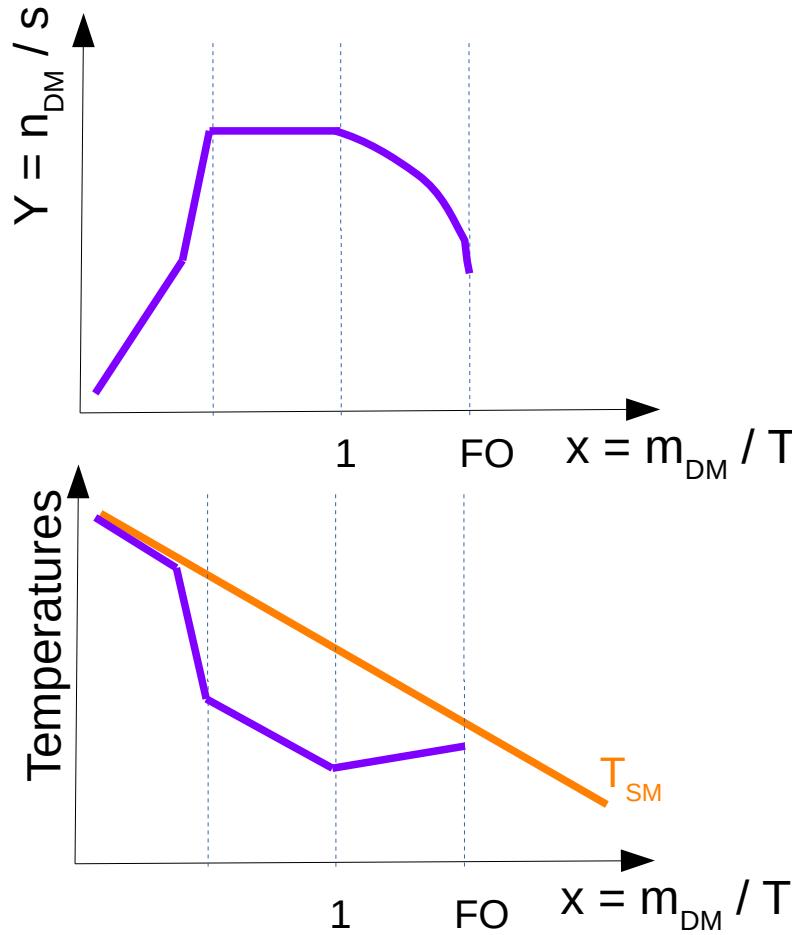

DM Production

- * Out-of-equilibrium production à la freeze-in: $h \rightarrow SS$
DM in kinetic equilibrium via $2 \leftrightarrow 2$
DM inherits SM temperature
- * DM populates rapidly via out-of-equilibrium $2 \rightarrow 4$.
Price to pay: Dramatic decrease of T_{DM}

Thermal Equilibrium

- * Chemical equilibrium $2 \leftrightarrow 4$

(Non-) Thermal evolution of DM

DM Production

- * Out-of-equilibrium production à la freeze-in: $h \rightarrow SS$
DM in kinetic equilibrium via $2 \leftrightarrow 2$
DM inherits SM temperature
- * DM populates rapidly via out-of-equilibrium $2 \rightarrow 4$.
Price to pay: Dramatic decrease of T_{DM}

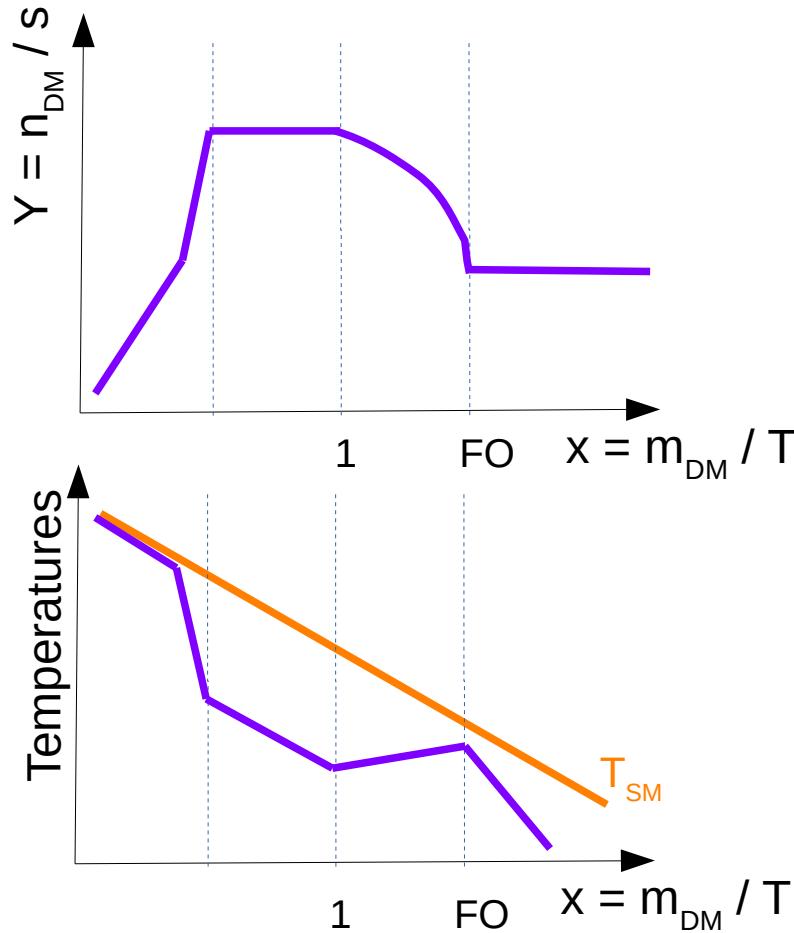

Thermal Equilibrium

- * Chemical equilibrium $2 \leftrightarrow 4$

DM Annihilation

- * Freeze-out $4 \rightarrow 2$

(Non-) Thermal evolution of DM

DM Production

- * Out-of-equilibrium production à la freeze-in: $h \rightarrow SS$
DM in kinetic equilibrium via $2 \leftrightarrow 2$
DM inherits SM temperature
- * DM populates rapidly via out-of-equilibrium $2 \rightarrow 4$.
Price to pay: Dramatic decrease of T_{DM}

Thermal Equilibrium

- * Chemical equilibrium $2 \leftrightarrow 4$

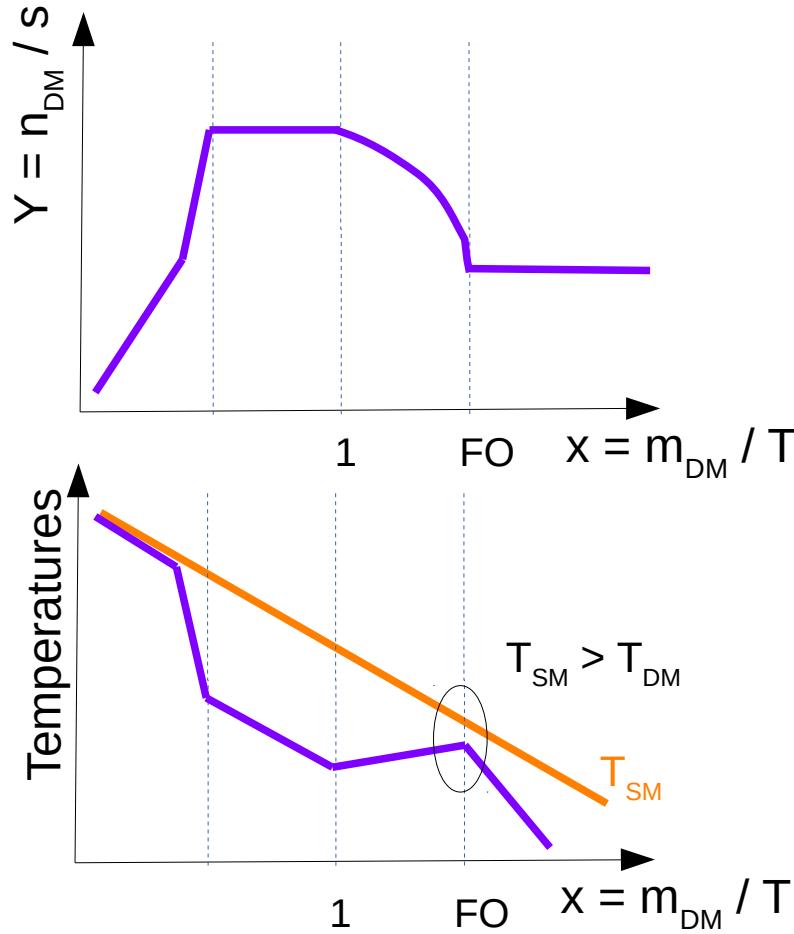

DM Annihilation

- * Freeze-out $4 \rightarrow 2$

After the Freeze-out

- * Relic abundance
Non-relativistic DM cools down faster

(Non-) Thermal evolution of DM

DM Production

- * Out-of-equilibrium production à la freeze-in: $h \rightarrow SS$
DM in kinetic equilibrium via $2 \leftrightarrow 2$
DM inherits SM temperature
- * DM populates rapidly via out-of-equilibrium $2 \rightarrow 4$.
Price to pay: Dramatic decrease of T_{DM}

Thermal Equilibrium

- * Chemical equilibrium $2 \leftrightarrow 4$

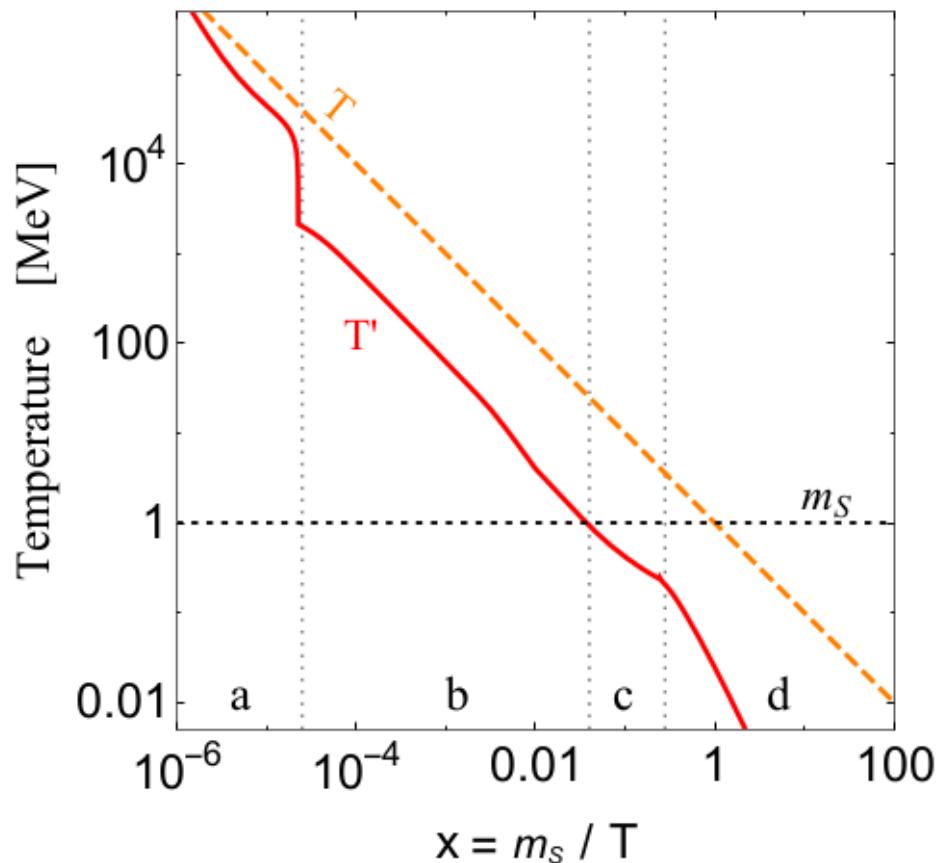

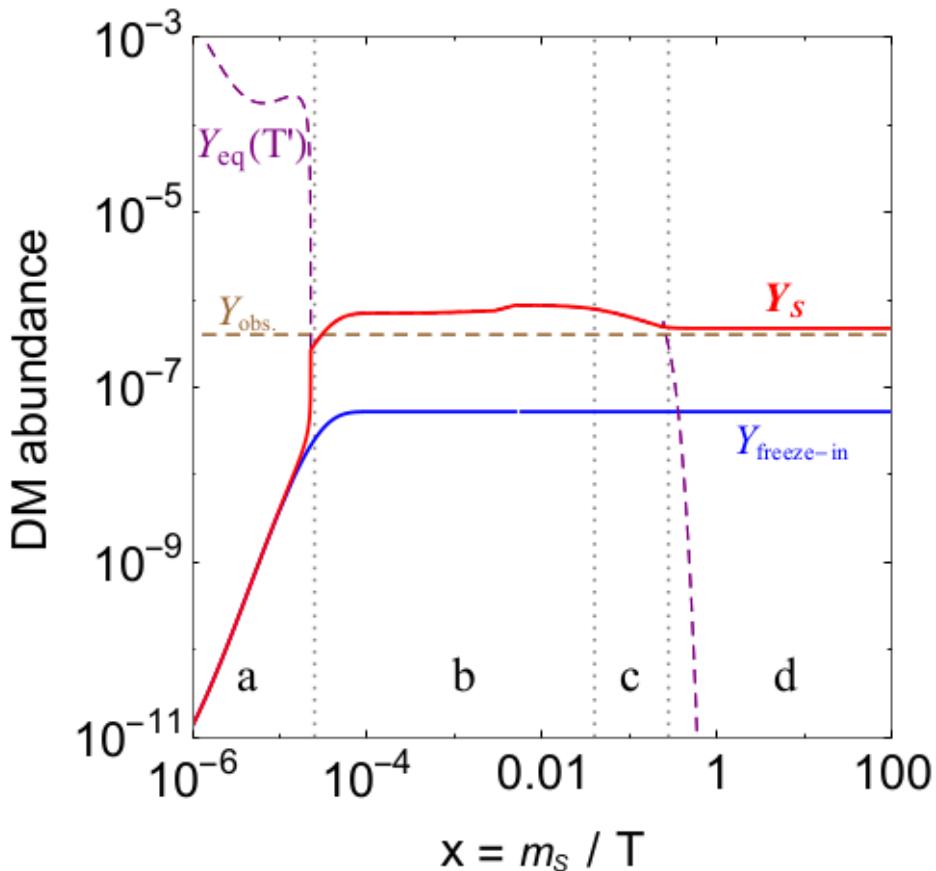

DM Annihilation

- * Freeze-out $4 \rightarrow 2$

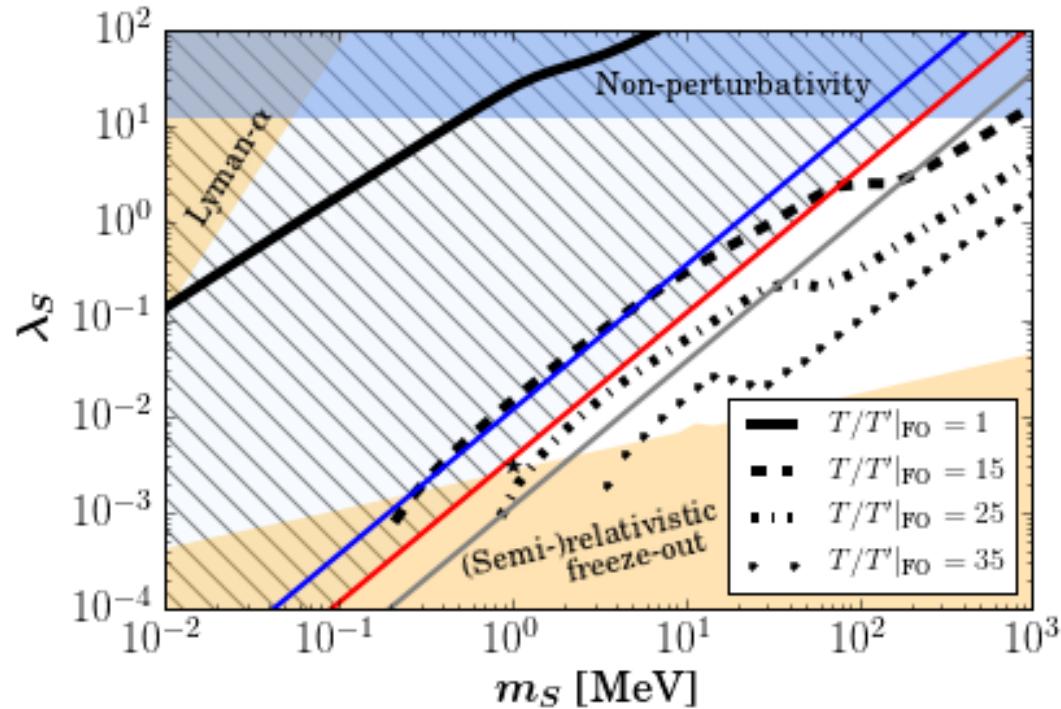

After the Freeze-out

- * Relic abundance
Non-relativistic DM cools down faster

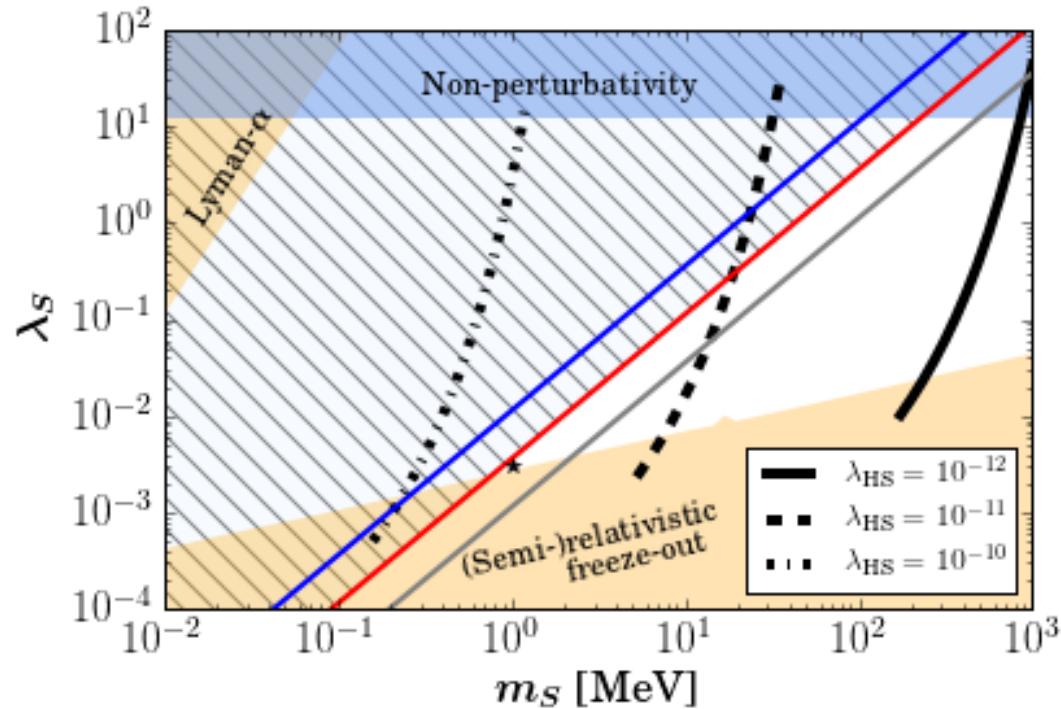

Generating $T_{\text{DM}} < T_{\text{SM}}$ via the Higgs Portal

Singlet Scalar DM $4 \rightarrow 2$ annihilations

Singlet Scalar DM $4 \rightarrow 2$ annihilations

**$3 \rightarrow 2$ annihilations can also do the job:
Hidden Vector Dark Matter**

Hidden Vector DM

T. Hambye '08

$SU(2)_{\text{DM}}$ with gauge boson $A_\mu + \varphi$ scalar doublet with no SM charges

$$\mathcal{L} = \mathcal{L}_{SM} - \frac{1}{4} F'^{\mu\nu} \cdot F'_{\mu\nu} + (D_\mu \phi)^\dagger (D^\mu \phi) - \mu_\phi^2 \phi^\dagger \phi - \lambda_\phi (\phi^\dagger \phi)^2 - \lambda_m \phi^\dagger \phi H^\dagger H$$

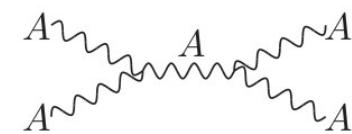

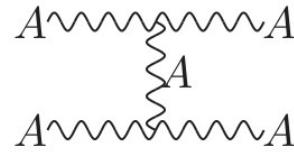

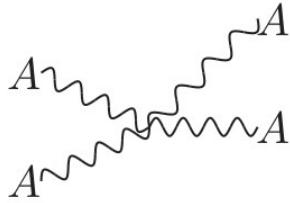

φ spontaneously break the $SU(2)_{\text{DM}} \rightarrow$ accidental $SO(3)_{\text{DM}}$ symmetry

4 free parameters:

- * m_A DM mass
- * α_x gauge coupling
- * m_φ φ mass
- * λ_m Higgs portal

Hidden Vector DM

Self-Interactions

$$\sigma_{AA} = \frac{65}{9} \frac{\alpha_X^2}{m_A^2} \left[1 + \mathcal{O} \left(\frac{m_A^2}{m_\eta^2} \right) \right]$$

$$\frac{\sigma_{SS}}{m_S} \sim O(1) \text{ cm}^2/\text{g}$$

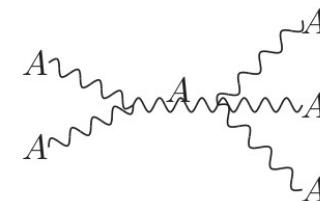

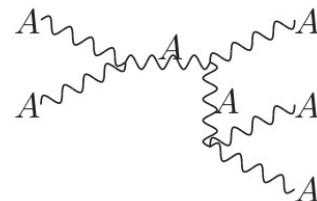

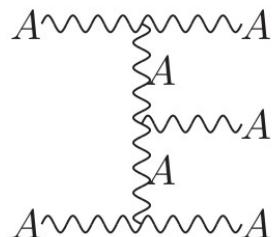

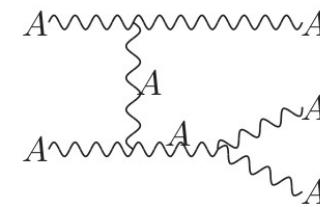

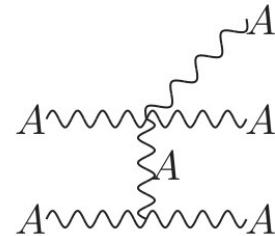

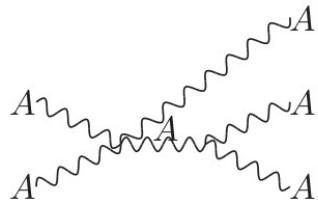

Implies $\left\{ \begin{array}{l} {}^* \alpha_X \sim 1 \\ {}^* m_A \sim 100 \text{ MeV} \end{array} \right.$

Assuming there's no light mediator! $m_\phi > m_A$

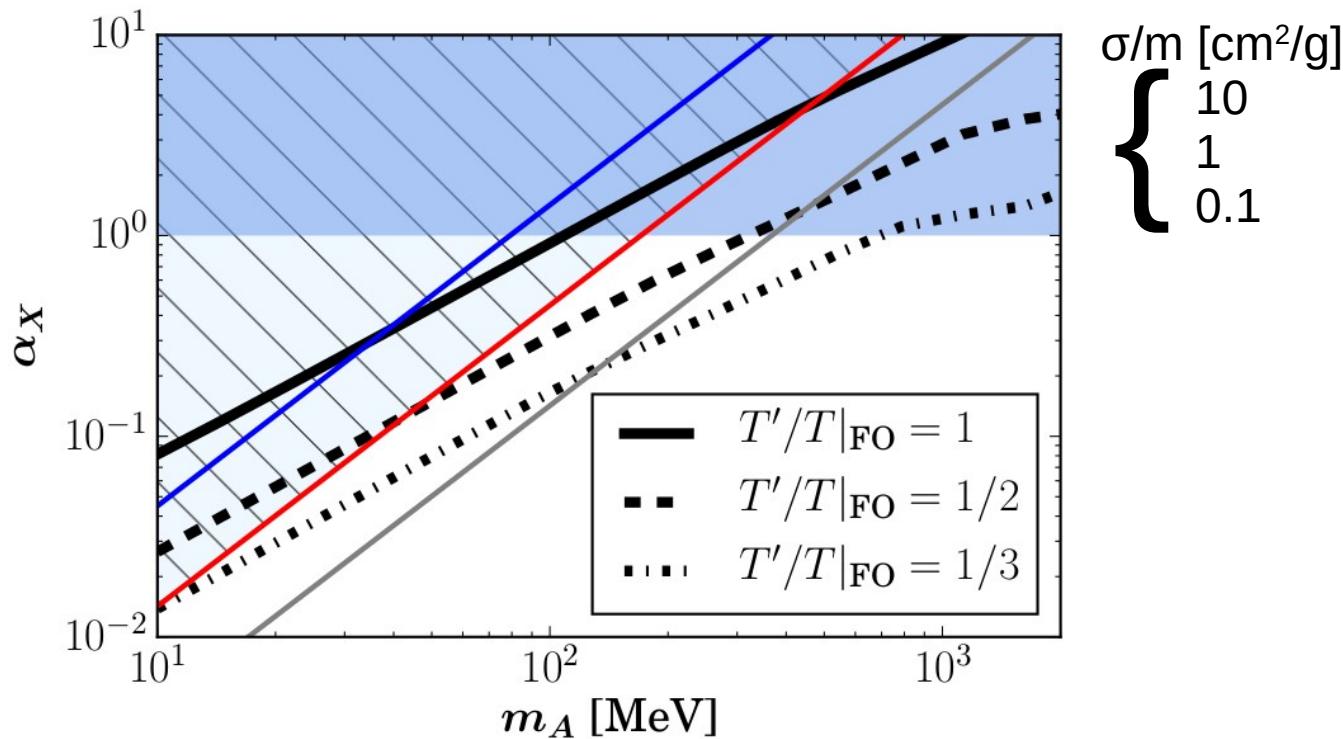

Hidden Vector DM

$3 \rightarrow 2$ annihilations

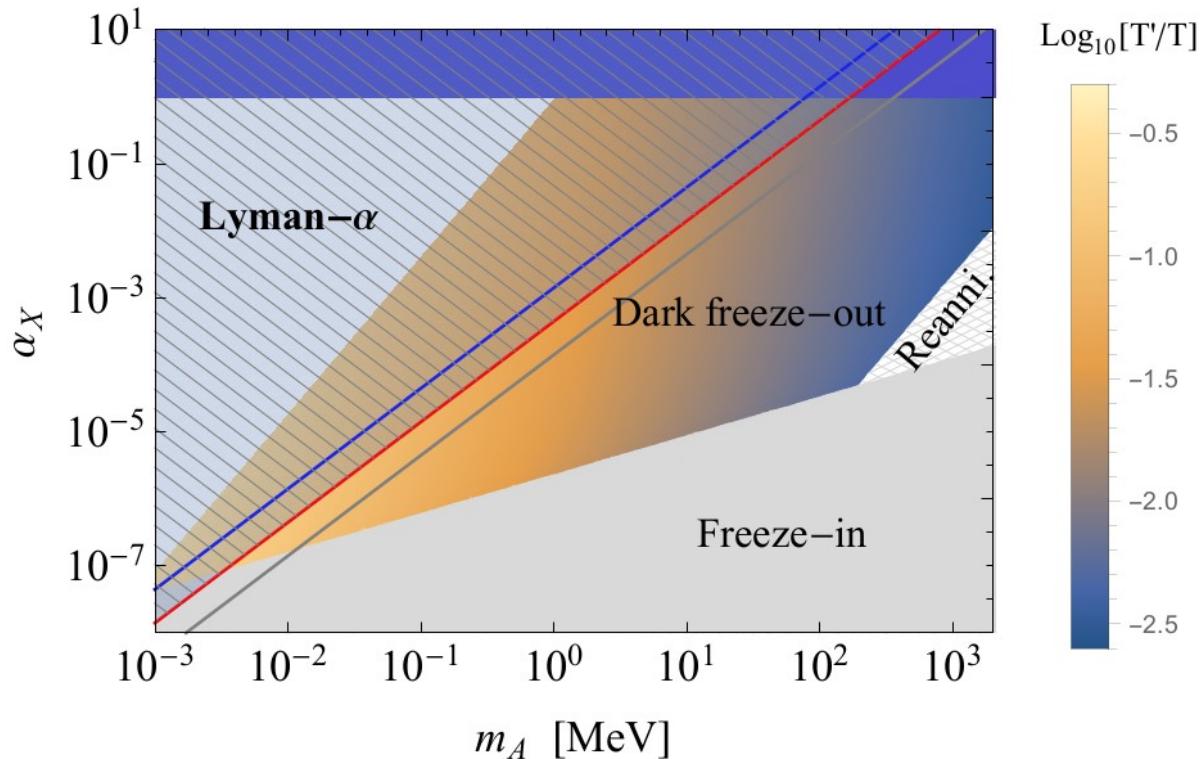

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^2 \rangle_{3 \rightarrow 2} (n^3 - n^2 n_{\text{eq}})$$

Hidden Vector DM $3 \rightarrow 2$ annihilations

Hidden Vector DM $3 \rightarrow 2$ annihilations

Now let's Split SIMPs! :-)

Splitting SIMPs

- Fermionic DM:

Dirac fermion Ψ split by small Majorana masses m_L and m_R .

$$\mathcal{L}_\Psi = \bar{\Psi} (i \not{D} - M_D) \Psi - \frac{m_L}{2} (\bar{\Psi}^c P_L \Psi + h.c.) - \frac{m_R}{2} (\bar{\Psi}^c P_R \Psi + h.c.)$$

$$\chi_1 \simeq \frac{i}{\sqrt{2}} (\Psi - \Psi^c), \quad \chi_2 \simeq \frac{1}{\sqrt{2}} (\Psi + \Psi^c)$$

$$\text{Pseudo-Dirac } \chi_{1,2} : \quad m_{1,2} \simeq M_D \mp \frac{m_L + m_R}{2} + O(\delta),$$

Splitting SIMPs

- Fermionic DM:

Dirac fermion Ψ split by small Majorana masses m_L and m_R .

$$\mathcal{L}_\Psi = \bar{\Psi} (i \not{D} - M_D) \Psi - \frac{m_L}{2} (\bar{\Psi}^c P_L \Psi + h.c.) - \frac{m_R}{2} (\bar{\Psi}^c P_R \Psi + h.c.)$$

$$\chi_1 \simeq \frac{i}{\sqrt{2}} (\Psi - \Psi^c), \quad \chi_2 \simeq \frac{1}{\sqrt{2}} (\Psi + \Psi^c)$$

$$\text{Pseudo-Dirac } \chi_{1,2} : \quad m_{1,2} \simeq M_D \mp \frac{m_L + m_R}{2} + O(\delta),$$

- The gauged dark $U(1)$ symmetry explicitly broken by Δm
→ the interaction with DM proceeds off-diagonally!

$$\mathcal{L}_{\text{int}, \chi} = i g_V \bar{\chi}_1 \gamma^\mu \chi_2 V_\mu + O(\delta)$$

- The dark gauge boson:

$$\mathcal{L}_V = -\frac{1}{4} V_{\mu\nu} V^{\mu\nu} + \frac{m_V^2}{2} V^2 - \kappa V_\mu J_\text{SM}^\mu$$

Splitting SIMPs

- Fermionic DM:

Dirac fermion Ψ split by small Majorana masses m_L and m_R .

$$\mathcal{L}_\Psi = \bar{\Psi} (i \not{D} - M_D) \Psi - \frac{m_L}{2} (\bar{\Psi}^c P_L \Psi + h.c.) - \frac{m_R}{2} (\bar{\Psi}^c P_R \Psi + h.c.)$$

$$\chi_1 \simeq \frac{i}{\sqrt{2}} (\Psi - \Psi^c), \quad \chi_2 \simeq \frac{1}{\sqrt{2}} (\Psi + \Psi^c)$$

$$\text{Pseudo-Dirac } \chi_{1,2} : \quad m_{1,2} \simeq M_D \mp \frac{m_L + m_R}{2} + O(\delta),$$

- The gauged dark $U(1)$ symmetry explicitly broken by Δm
→ the interaction with DM proceeds off-diagonally!

$$\mathcal{L}_{\text{int}, \chi} = i g_V \bar{\chi}_1 \gamma^\mu \chi_2 V_\mu + O(\delta)$$

- The dark gauge boson:

$$\mathcal{L}_V = -\frac{1}{4} V_{\mu\nu} V^{\mu\nu} + \frac{m_V^2}{2} V^2 - \kappa V_\mu J_{\text{SM}}^\mu$$

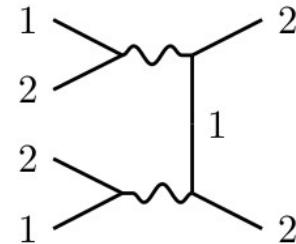

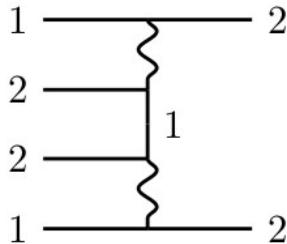

Free parameters:
 m , Δm , m_ν , g_ν and κ .

Producing Split SIMPs

Split SIMPs

$4 \rightarrow 2$ annihilations

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^3 \rangle_{4 \rightarrow 2} (n^4 - n^2 n_{\text{eq}}^2)$$

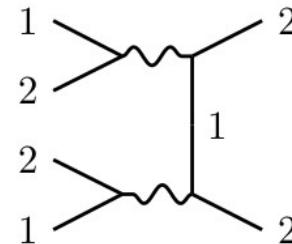

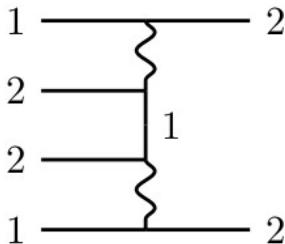

We take $m_\nu > m_1 + m_2$

Split SIMPs

$4 \rightarrow 2$ annihilations

$$\frac{dn}{dt} + 3 H n = -\langle \sigma v^3 \rangle_{4 \rightarrow 2} (n^4 - n^2 n_{\text{eq}}^2)$$

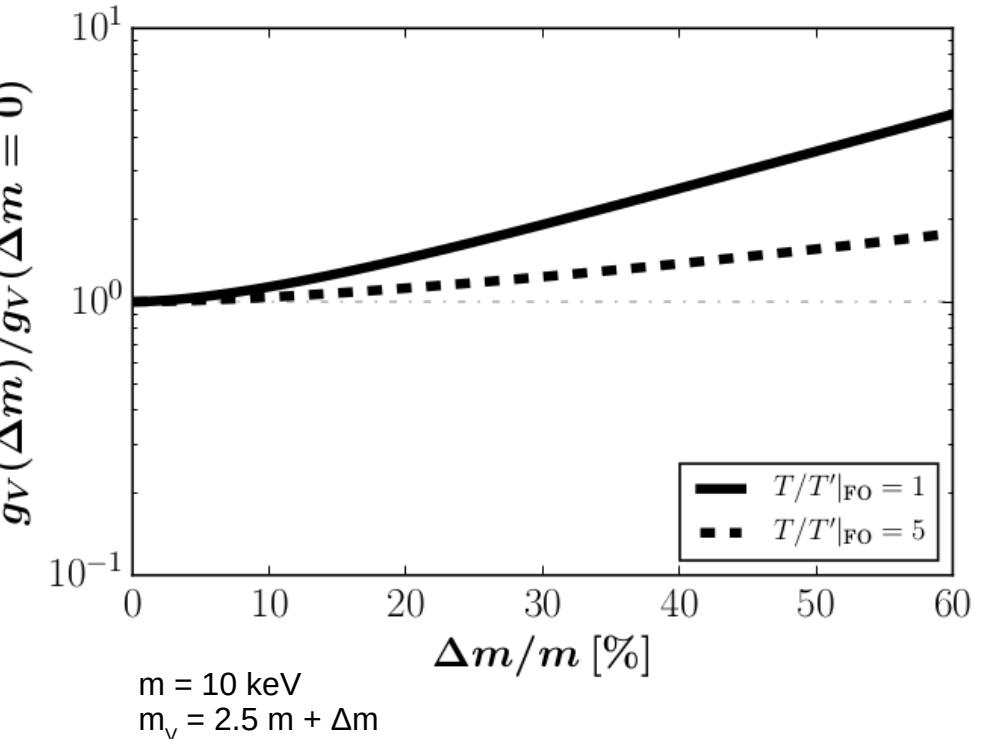

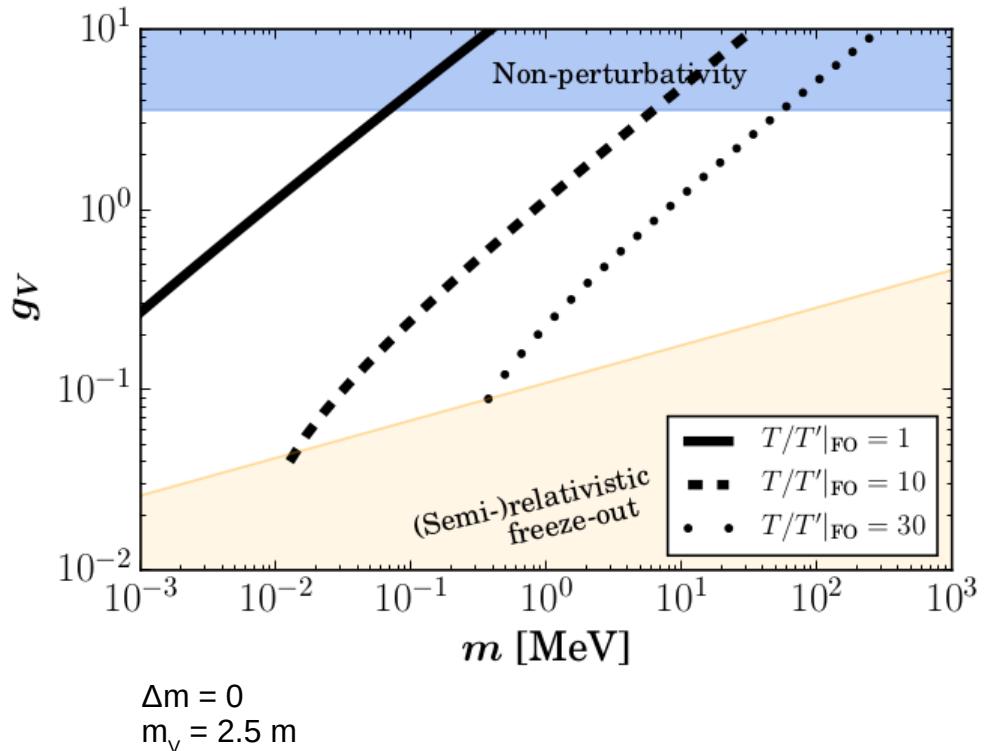

$$\langle \sigma v^3 \rangle_{4 \rightarrow 2} = [\langle 1122 \rightarrow 22 \rangle + \langle 1122 \rightarrow 11 \rangle] \frac{R^2}{(1+R)^4}$$

We take $m_V > m_1 + m_2$

$$\langle 1122 \rightarrow 11 \rangle = \langle 1122 \rightarrow 22 \rangle = \frac{27\sqrt{3} g_V^8}{32\pi} \frac{(m_V^4 - 8m^2 m_V^2 - 8m^4)^2}{(m_V^4 - 2m^2 m_V^2 - 8m^4)^4}$$

Split SIMPs

$4 \rightarrow 2$ annihilations

Astrophysical Implications of Split SIMPs

(Late) Decay of the State 2

The decay of state 2 into state 1 is accompanied by SM radiation, possibly constrained by BBN and CMB.

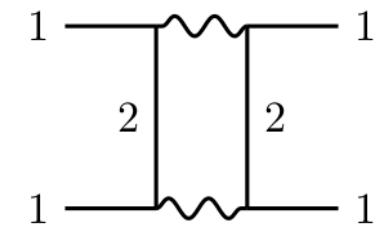

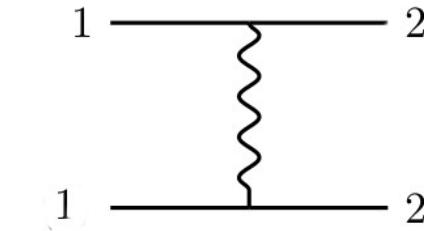

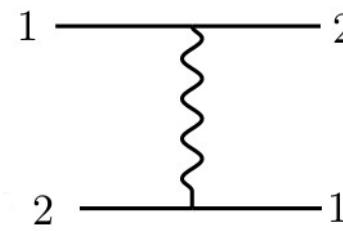

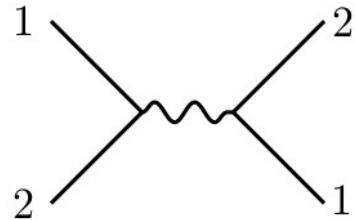

$$\chi_2 \rightarrow \chi_1 V^* \rightarrow \chi_1 e^+ e^-$$

$$\Gamma_{\chi_2 \rightarrow \chi_1 e^+ e^-} \simeq \frac{2\alpha \alpha_V \kappa^2}{15\pi} \frac{\Delta m^5}{m_V^4} \simeq 2 H_0 \times \frac{m}{100 \text{ MeV}} \frac{\alpha_V}{\alpha} \left(\frac{\kappa}{10^{-10}} \right)^2 \left(\frac{\Delta m/m}{10^{-3}} \right)^5 \left(\frac{m}{m_V} \right)^4$$

$$\chi_2 \rightarrow \chi_1 V^* \rightarrow \chi_1 3\gamma,$$

$$\begin{aligned} \Gamma_{\chi_2 \rightarrow \chi_1 3\gamma} &\simeq \Gamma_{\chi_2 \rightarrow \chi_1 \nu \bar{\nu}} \times \left. \frac{\Gamma_{V \rightarrow 3\gamma}}{\Gamma_{V \rightarrow \nu \bar{\nu}}} \right|_{m_V \rightarrow \Delta m} \\ &\simeq H_0 \times \left(\frac{m}{50 \text{ MeV}} \right)^9 \frac{\alpha_V}{\alpha} \left(\frac{\kappa}{10^{-10}} \right)^2 \left(\frac{\Delta m/m}{10^{-2}} \right)^{13} \left(\frac{m}{m_V} \right)^4 \end{aligned}$$

Self-scatterings

$$\frac{\sigma_{\text{eff}}^{\text{SI}}}{m} \equiv R_0 \frac{\sigma_{12}}{m} + \frac{\langle \sigma_{\text{en}} v \rangle}{m v} + \frac{\sigma_{\text{rad}}}{m} \lesssim 1 \text{ cm}^2/\text{g}$$

Free-streaming Length

4-to-2
'reheat' DM
Increasing the FSL

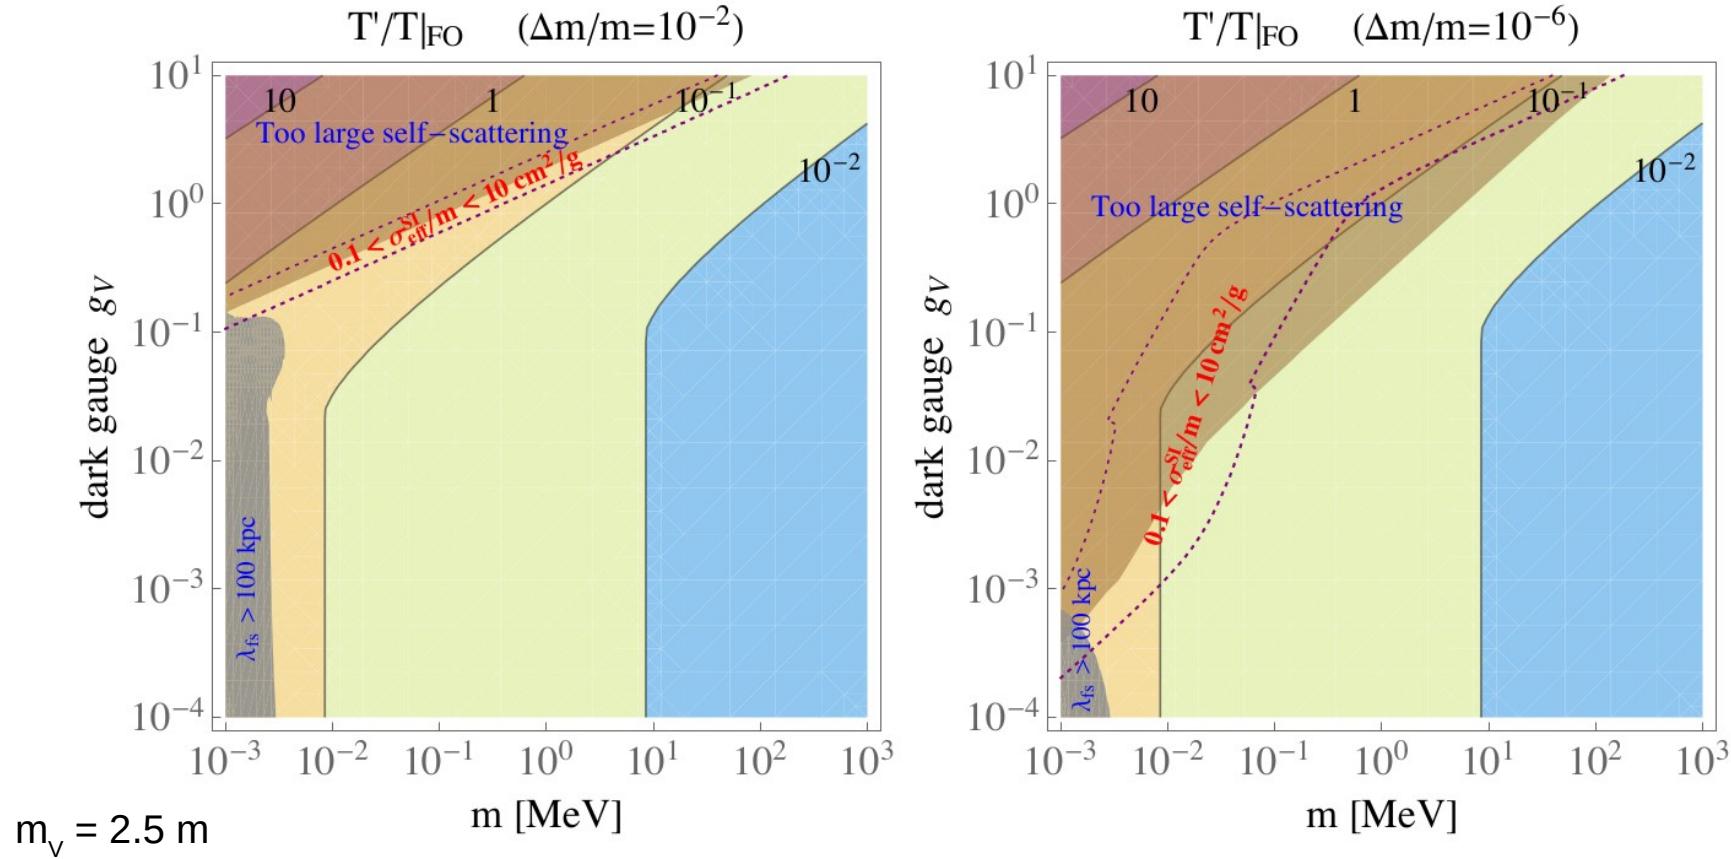

← Versus →

2-to-2
Self-interactions
Decrease the FSL

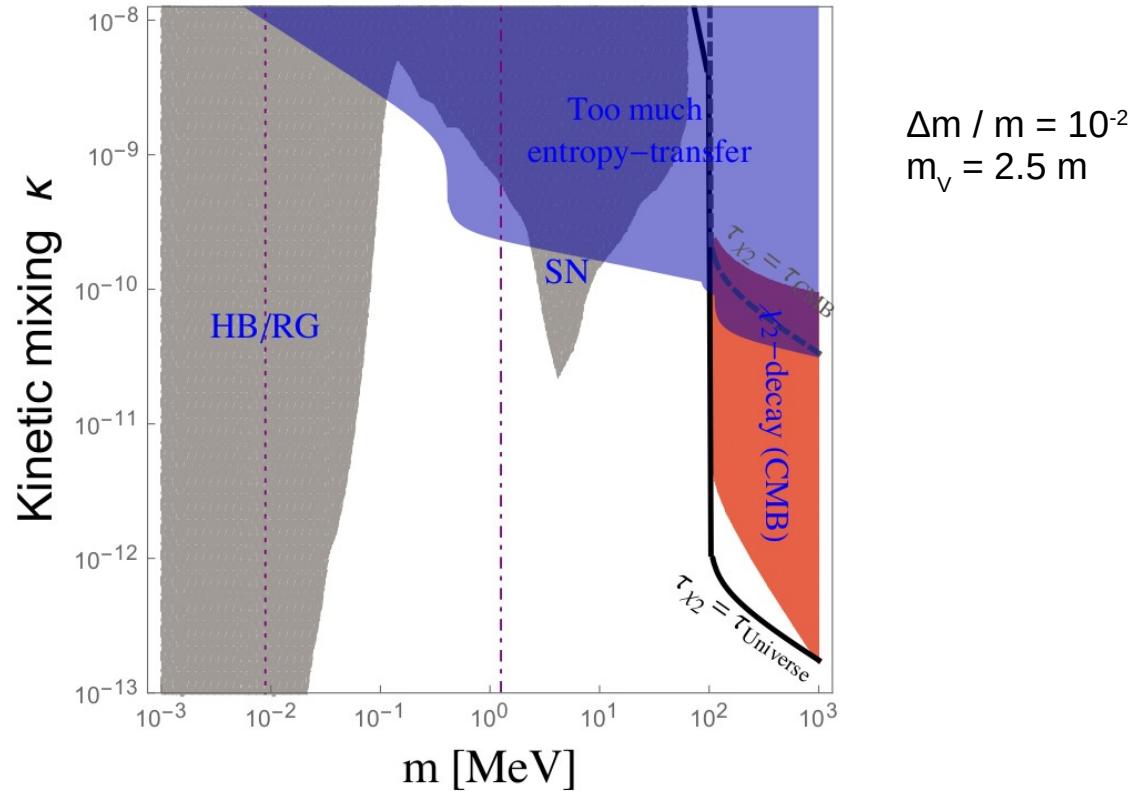

$$\lambda_{\text{fs}} = \int_{t_k}^{t_{\text{eq}}} \frac{v_\chi(t)}{a(t)} dt \sim \frac{26 \text{ kpc}}{\sqrt{g_\star(T_k)}} \times \frac{10 \text{ keV}}{\sqrt{T_k m}} \left(\frac{T'_k}{T_k} \right)^{1/2} \log_{10} \left(\frac{T_k}{T_{\text{eq}}} \right)$$

$$\lambda_{\text{fs}} \lesssim 100 \text{ kpc} \quad \leftarrow \text{Lyman-}\alpha$$

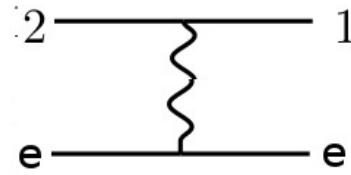

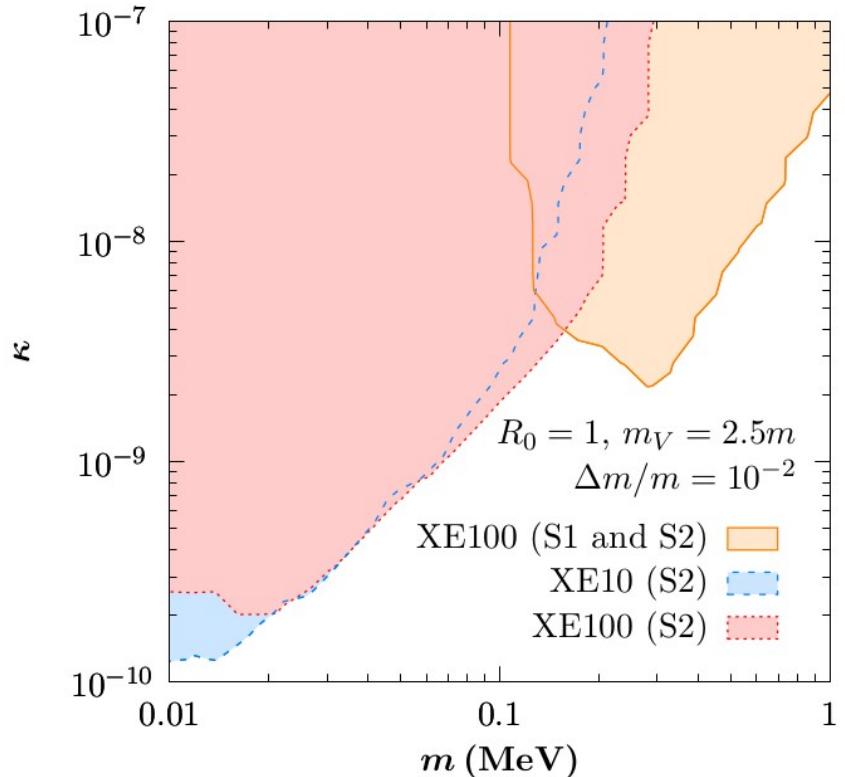

Astrophysical implications of Split SIMPs

Constraints on the Kinetic Mixing Portal

Exothermic DM-Electron Scattering

~ monochromatic signal!

On the verge of being
probable with reported data
(S1 and S2) from XENON100!

$$\bar{\sigma}_e = a \frac{16\pi \alpha \alpha_V \kappa^2 \mu_{\chi e}^2}{m_V^4} \simeq 10^{-44} \text{ cm}^2 a \frac{\alpha_V}{\alpha} \left(\frac{\kappa}{10^{-10}} \right)^2 \left(\frac{m}{100 \text{ keV}} \right)^2 \left(\frac{300 \text{ keV}}{m_V} \right)^4$$

Conclusions

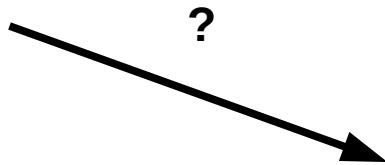

Small-scale anomalies

- * Cusp-vs-core
- * Too-big-to-fail

Conclusions

Small-scale anomalies

- * Cusp-vs-core
- * Too-big-to-fail

Self-Interacting Dark Matter

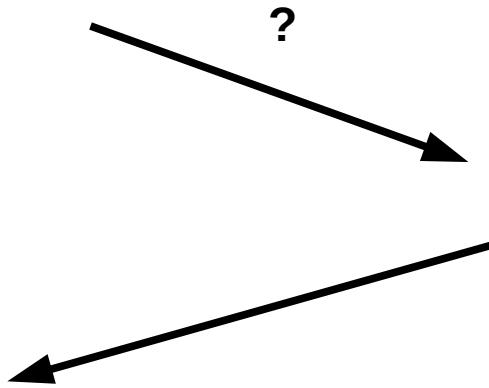

$$\frac{\sigma_{SS}}{m_S} \sim O(1) \text{ cm}^2/\text{g}$$

Conclusions

Small-scale anomalies

- * Cusp-vs-core
- * Too-big-to-fail

$$\left. \begin{array}{l} m_s \sim 100 \text{ MeV} \\ \lambda_s \sim 1 \\ \lambda_{hs} < 10^{-3} \end{array} \right\}$$

Self-Interacting Dark Matter

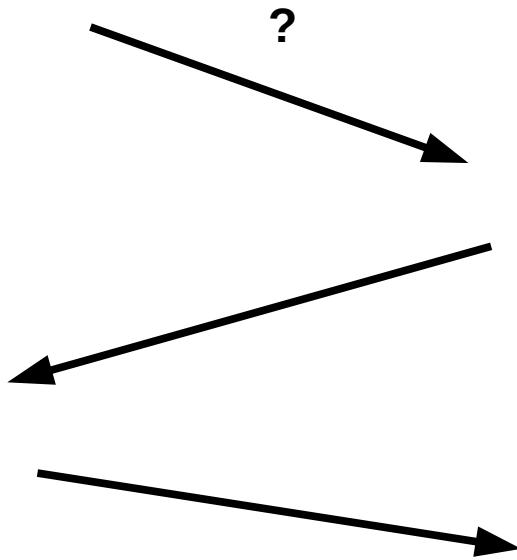

$$\frac{\sigma_{SS}}{m_S} \sim O(1) \text{ cm}^2/\text{g}$$

Conclusions

Small-scale anomalies

- * Cusp-vs-core
- * Too-big-to-fail

$$\left. \begin{array}{l} m_s \sim 100 \text{ MeV} \\ \lambda_s \sim 1 \\ \lambda_{hs} < 10^{-3} \end{array} \right\}$$

Self-Interacting Dark Matter

$$\frac{\sigma_{SS}}{m_S} \sim O(1) \text{ cm}^2/\text{g}$$

SIMP DM

- * dominant $N \rightarrow n$
- * need to avoid the 'DM reheating'
 - + kinetic equilibrium $\text{SM} \leftrightarrow \text{DM}$
 - + dark sector with relativistic particles @ FO
 - + SM and DM never in kinetic equilibrium

Conclusions

- Self-interacting DM with no light mediators → SIMP DM
- SIMP DM generated via $3 \rightarrow 2$ or $4 \rightarrow 2$ annihilations
- DM: MeV ballpark, ‘large’ self-interactions & ‘small’ portal with the SM
- If SM - DM sectors could be naturally out of kinetic equilibrium:
difference of temperatures *dynamically* produced via freeze-in.
- *DM Self-interactions can play a major role in DM genesis.*
- SIMPs offer a new window to DM: Points to different physical scales beyond the usual WIMP and FIMP paradigms

Muchas gracias!
