メロメメ 倒 メメ ミメメ 毛

- Bilevel optimization (Colson et al., 2007) is a fundamental optimization problem that abstracts various applications characterized by two-level hierarchical structures.
- Consider the minimization problem:

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y), \tag{P}
$$

where  $f, g : \mathbb{R}^{d_x} \times \mathbb{R}^{d_y} \to \mathbb{R}$  are continuously-differentiable functions.

There are various applications, including adversarial networks (Goodfellow et al., 2020; Gidel et al., 2018), game theory (Stackelberg et al., 1952), hyper-parameter optimization (Franceschi et al., 2018; Bao et al., 2021), model selection (Kunapuli et al., 2008; Giovannelli et al., 2021) and reinforcement learning (Konda & Tsitsiklis, 1999; Sutton & Barto, 2018).

 $298$ 

<span id="page-3-0"></span> $\left\{ \begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \end{array} \right.$  ,  $\left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right.$ 

- Bilevel optimization (Colson et al., 2007) is a fundamental optimization problem that abstracts various applications characterized by two-level hierarchical structures.
- Consider the minimization problem:

```
min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))s.t. y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y),
```
# where  $f$ ,  $g : \mathbb{R}^{d_x} \times \mathbb{R}^{d_y} \to \mathbb{R}$  are continuously-differentiable functions.

## Bilevel optimization

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y). \tag{P}
$$

- The hyperobjective  $F(x)$  depends on x both directly and indirectly via  $y^*(x)$ .
- $y^*(x)$  is a solution for the lower-level problem of minimizing another function g.
- Typically, we assume that the lower-level problem is strongly convex:  $g(\bar{x}, y)$  is strongly convex in y for all  $\bar{x} \in \mathbb{R}^{d_{\mathrm{x}}}.$

 $\left\{ \begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \end{array} \right.$  ,  $\left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right.$ 

 $min_{x \in \mathbb{R}^{d_x}}$   $F(x) := f(x, y^*(x))$ s.t.  $y^*(x) \in \arg \min_{y \in \mathbb{R}^{d_y}} g(x, y)$ .

- The hyperobjective  $F(x)$  depends on x both directly and indirectly via  $y^*(x)$ .
- $y^*(x)$  is a solution for the lower-level problem of minimizing another function g.
- Typically, we assume that the lower-level problem is strongly convex:  $g(\bar{x}, y)$  is strongly convex in y for all  $\bar{x} \in \mathbb{R}^{d_{\mathrm{x}}}.$

 $298$ 

## Problem

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y). \tag{P}
$$

#### Problem

Find an  $\epsilon$ -stationary point: a point x satisfying  $\|\nabla F(x)\| \leq \epsilon$ .

The explicit expression of  $\nabla F(x)$  can be derived from the implicit function theorem:  $\odot$ 

$$
\nabla F(x) := \nabla_{x} f(x, y^{*}(x)) - \nabla_{xy}^{2} g(x, y^{*}(x)) (\nabla_{yy}^{2} g(x, y^{*}(x)))^{-1} \nabla_{y} f(x, y^{*}(x)).
$$

- $\bullet$  Prior approaches require an explicit extraction of second-order information from g with a major focus on estimating the Jacobian and inverse Hessian efficiently with stochastic noises.
- Algorithms are not applicable to nonconvex objectives  $g$  and are hard to extend to the constrained case.

 $299$ 

 $\left\{ \begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \end{array} \right.$ 

### Problem

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t. } y^*(x) \in \arg \min_{y \in \mathbb{R}^{d_y}} g(x, y).
$$

#### Problem

Find an  $\epsilon$ -stationary point: a point x satisfying  $\|\nabla F(x)\| \leq \epsilon$ .

• The explicit expression of  $\nabla F(x)$  can be derived from the implicit function theorem:

$$
\nabla F(x) := \nabla_x f(x, y^*(x)) - \nabla^2_{xy} g(x, y^*(x)) (\nabla^2_{yy} g(x, y^*(x)))^{-1} \nabla_y f(x, y^*(x)).
$$

- $\bullet$  Prior approaches require an explicit extraction of second-order information from g with a major focus on estimating the Jacobian and inverse Hessian efficiently with stochastic noises.
- Algorithms are not applicable to nonconvex objectives  $g$  and are hard to extend to the constrained case.

 $298$ 

 $\mathbf{A} \sqsubseteq \mathbf{A} \rightarrow \mathbf{A} \boxplus \mathbf{B} \rightarrow \mathbf{A} \boxplus \mathbf{B} \rightarrow \mathbf{A} \boxplus \mathbf{B}$ 

### Problem

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t. } y^*(x) \in \arg \min_{y \in \mathbb{R}^{d_y}} g(x, y).
$$

#### Problem

Find an  $\epsilon$ -stationary point: a point x satisfying  $\|\nabla F(x)\| \leq \epsilon$ .

• The explicit expression of  $\nabla F(x)$  can be derived from the implicit function theorem:

$$
\nabla F(x) := \nabla_x f(x, y^*(x)) - \nabla^2_{xy} g(x, y^*(x)) (\nabla^2_{yy} g(x, y^*(x)))^{-1} \nabla_y f(x, y^*(x)).
$$

- $\bullet$  Prior approaches require an explicit extraction of second-order information from g with a major focus on estimating the Jacobian and inverse Hessian efficiently with stochastic noises.
- Algorithms are not applicable to nonconvex objectives  $g$  and are hard to extend to the constrained case.

 $298$ 

 $\mathbf{A} \sqsubseteq \mathbf{A} \rightarrow \mathbf{A} \boxplus \mathbf{B} \rightarrow \mathbf{A} \boxplus \mathbf{B} \rightarrow \mathbf{A} \boxplus \mathbf{B}$ 

### Our goal

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y). \tag{P}
$$

**← ロ ▶ → イ 何 →** 

### Goal

Develop a fully first-order approach for stochastic bilevel optimization. Find an  $\epsilon$ -stationary solution of  $F$  using only first-order gradients of  $f$  and  $g$ .

• Some works only use first-order information, but these works either lack a complete finite-time analysis or are applicable only to deterministic functions.

# Stochastic bilevel optimization

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$
\n
$$
\text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y), \tag{P}
$$

. We consider the first-order algorithm class that accesses functions through first-order oracles that return estimators of first-order derivatives  $\hat{\nabla}f(x, y; \zeta), \hat{\nabla}g(x, y; \xi)$  for a given query point  $(x, y)$ .

We assume that

The estimators are unbiased:  $\alpha$ 

> $\mathbb{E}[\hat{\nabla}f(x, y; \zeta)] = \nabla f(x, y),$  $\mathbb{E}[\hat{\nabla}g(x, y; \xi)] = \nabla g(x, y).$

The variance of the estimators are bounded:

 $\mathbb{E}[\|\hat{\nabla}f(x,y;\zeta)-\mathbb{E}[\nabla f(x,y;\zeta)]\|^2]\leq \sigma_f^2,$  $\mathbb{E}[\Vert \hat{\nabla}g(x,y;\xi)-\mathbb{E}[\nabla g(x,y;\xi)]\Vert^2]\leq \sigma_g^2.$ 

for constants  $\sigma_f^2 > 0$  and  $\sigma_g^2 > 0$ .

 $QQ$ 

 $\left\{ \begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \end{array} \right.$  ,  $\left\{ \begin{array}{ccc} \frac{1}{2} & 0 & 0 \\ 0 & 0 & 0 \end{array} \right.$ 

# Stochastic bilevel optimization

min  $x\in\mathbb{R}^{d_x}$  $F(x) := f(x, y^*(x))$ s.t.  $y^*(x) \in \arg \min_{y \in \mathbb{R}^{d_y}} g(x, y),$ 

. We consider the first-order algorithm class that accesses functions through first-order oracles that return estimators of first-order derivatives  $\hat{\nabla}f(x, y; \zeta), \hat{\nabla}g(x, y; \zeta)$  for a given query point  $(x, y)$ .

We assume that

**• The estimators are unbiased:** 

 $\mathbb{E}[\hat{\nabla}f(x, y; \zeta)] = \nabla f(x, y),$  $\mathbb{E}[\hat{\nabla}g(x, y; \xi)] = \nabla g(x, y).$ 

The variance of the estimators are bounded:

 $\mathbb{E}[\|\hat{\nabla}f(x,y;\zeta)-\mathbb{E}[\nabla f(x,y;\zeta)]\|^2]\leq \sigma_f^2,$  $\mathbb{E}[\Vert \hat{\nabla}g(x,y;\xi)-\mathbb{E}[\nabla g(x,y;\xi)]\Vert^2]\leq \sigma_g^2.$ 

for constants  $\sigma_f^2 > 0$  and  $\sigma_g^2 > 0$ .

 $QQ$ 

# Stochastic bilevel optimization

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x))
$$

### Penalty method

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x)) \quad \text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y),
$$

 $\bullet$  The starting point of our approach is to convert  $(P)$  $(P)$  $(P)$  to an equivalent constrained single-level version:

$$
\min_{x \in X, y \in \mathbb{R}^{d_y}} f(x, y) \quad \text{s.t.} \quad g(x, y) - g^*(x) \leq 0,
$$

where  $g^*(x) := g(x, y^*(x)).$ 

• The Lagrangian  $\mathcal{L}_{\lambda}$  with multiplier  $\lambda > 0$  is

$$
\mathcal{L}_{\lambda}(x,y):=f(x,y)+\lambda(g(x,y)-g^*(x)).
$$

• The gradient of  $\mathcal{L}_{\lambda}$  can be computed only with gradients of f and g, and thus the entire procedure can be implemented using only first-order derivatives. This reformulation has been attempted by (Liu et al., 2021; Sow et al., 2022; Ye et al., 2022)).

 $298$ 

## Difficulties in penalty method

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x)) \quad \text{s.t.} \quad y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y), \tag{P}
$$

$$
\mathcal{L}_{\lambda}(x,y):=f(x,y)+\lambda(g(x,y)-g^*(x)).
$$

- $\bullet$  The challenge is to find an appropriate value of the multiplier  $\lambda$ . Unfortunately, the desired solution  $x^* = \arg \min_x F(x)$  can only be obtained at  $\lambda = \infty$ .
- With  $\lambda = \infty$ ,  $\mathcal{L}_{\lambda}(x, y)$  has unbounded smoothness, which prevents us from employing gradient-descent style approaches.
- None of the previously proposed algorithms can obtain a complete finite time analysis for the original problem min<sub>x</sub>  $F(x)$  without access to second derivatives of g.

 $298$ 

## Difficulties in penalty method

$$
\min_{x \in \mathbb{R}^{d_x}} \quad F(x) := f(x, y^*(x)) \quad \text{s.t.} \quad y^*(x) \in \arg \min_{y \in \mathbb{R}^{d_y}} g(x, y),
$$

$$
\mathcal{L}_{\lambda}(x,y):=f(x,y)+\lambda(g(x,y)-g^*(x)).
$$

- $\bullet$  The challenge is to find an appropriate value of the multiplier  $\lambda$ . Unfortunately, the desired solution  $x^* = \arg \min_x F(x)$  can only be obtained at  $\lambda = \infty$ .
- With  $\lambda = \infty$ ,  $\mathcal{L}_{\lambda}(x, y)$  has unbounded smoothness, which prevents us from employing gradient-descent style approaches.
- None of the previously proposed algorithms can obtain a complete finite time analysis for the original problem min<sub>x</sub>  $F(x)$  without access to second derivatives of g.

 $298$ 

$$
\min_{x \in \mathbb{R}^{d_x}} F(x) := f(x, y^*(x)) \quad \text{s.t.} \quad y^*(x) \in \arg \min_{y \in \mathbb{R}^{d_y}} g(x, y), \tag{P}
$$

$$
\mathcal{L}_{\lambda}(x,y):=f(x,y)+\lambda(g(x,y)-g(x,y^*(x))).
$$

Set  $\mathcal{L}_{\lambda}^{*}(x) := \min_{y} \mathcal{L}_{\lambda}(x, y).$ 

F can be approximated by  $\mathcal{L}^*_{\lambda}(x)$  in the sense that

$$
\|\nabla F(x) - \nabla \mathcal{L}_{\lambda}^{*}(x)\| \le O(1/\lambda)
$$

$$
\nabla \mathcal{L}_{\lambda}^{*}(x) = \nabla_{x} f(x, y_{\lambda}^{*}(x)) + \lambda (\nabla_{x} g(x, y_{\lambda}^{*}(x)) - \nabla_{x} g(x, y^{*}(x)))
$$

and  $y^*_{\lambda}(x) := \arg\min_{y} (\lambda^{-1}f(x,y) + g(x,y)).$ 

Therefore, we can find an  $\epsilon$ -stationary point of  $\mathcal{L}^*_{\lambda}(x)$ , by running a stochastic gradient descent (SGD) style method on  $\mathcal{L}^*_{\lambda}(x)$  with  $\lambda = O(\epsilon^{-1}).$ メロメメ 倒 メメ ミメメ 毛

## Our main results

#### Theorem (J. Kwon-D. Kwon-Wright-Nowak, ICML 2023 Oral)

Under suitable assumptions and step-sizes, the following convergence results hold.

- $\bf{D}$  If stochastic noises are present in both upper-level objective f and lower-level objective g (i.e.,  $\sigma_f^2,\sigma_g^2>0$ ), then our algorithm finds an  $\epsilon$ -stationary point within  $O(\epsilon^{-7})$  iterations.
- $\bullet$  If we have access to exact information about  $f$  and  $g$  (i.e.,  $\sigma^2_f=\sigma^2_g=0$ ), then our algorithm finds an  $\epsilon$ -stationary point within  $O(\epsilon^{-3})$  iterations.

### Question

- **4** Are the convergence rates optimal?
- 2 Are the first-order methods necessarily slower than second-order methods?
- Under the additional assumption, it is known that the second-order methods find the  $\epsilon$ -stationary point within  $O(\epsilon^{-4})$ .

## Deterministic case

#### Inner-loop

Solve  $y_{\lambda_k}^*(x^k)$ , and  $y^*(x^k)$  (approximately).

• Indeed, these are convex optimization problems for large enough  $\lambda > 0$ :

$$
y^*(x) \in \arg\min_{y \in \mathbb{R}^{d_y}} g(x, y) \text{ and } y^*_\lambda(x) := \arg\min_{y} \left( \lambda^{-1} f(x, y) + g(x, y) \right).
$$

Using this idea, (Chen et al., 2024) improves the complexity of our proposed algorithm from  $O(\epsilon^{-3})$  to

## Stochastic case: optimal number of iterations

#### Outer-loop

Update  $x^k$  using  $\nabla \mathcal{L}^*_{\lambda}(x^k)$ :

$$
x^{k+1} = x^k - \alpha \hat{G}_k.
$$

$$
\nabla \mathcal{L}_{\lambda}^{*}(x^{k}) = \nabla_{x} f(x^{k}, y_{\lambda}^{*}(x^{k})) + \lambda (\nabla_{x} g(x^{k}, y_{\lambda}^{*}(x^{k})) - \nabla_{x} g(x^{k}, y^{*}(x^{k}))).
$$

$$
G_k := \nabla_x f(x^k, y^{k+1}) + \lambda (\nabla_x g(x^k, y^{k+1}) - \nabla_x g(x^k, z^{k+1}))
$$

 $\|\nabla \mathcal{L}_{\lambda}^*(x^k) - G_k\|$  can be estimated by

$$
\lambda(||y^{k+1} - y_{\lambda}^*(x^k)|| + ||z^{k+1} - y^*(x^k)||)
$$

To obtain  $\|\nabla \mathcal{L}_{\lambda}^*(x^k) - G_k\| = O(\epsilon)$ , we need  $O(\epsilon/\lambda) = O(\epsilon^2)$  accuracy of  $y^{k+1}$  and  $z^{k+1}$ .

 $T \asymp \epsilon^{-4}$  inner-loop iterations are required to have  $O(\epsilon^2)$  accuracy of  $y^{k+1}$  and  $z^{k+1}$  $z^{k+1}$ [.](#page-31-0)

## <span id="page-33-0"></span>Stochastic case: optimal number of iterations

#### Outer-loop

Update  $x^k$  using  $\nabla \mathcal{L}^*_{\lambda}(x^k)$ :

$$
x^{k+1} = x^k - \alpha \hat{G}_k.
$$

#### Comparing

$$
\nabla \mathcal{L}_{\lambda}^{*}(x^{k}) = \nabla_{x} f(x^{k}, y_{\lambda}^{*}(x^{k})) + \lambda (\nabla_{x} g(x^{k}, y_{\lambda}^{*}(x^{k})) - \nabla_{x} g(x^{k}, y^{*}(x^{k}))).
$$

and

$$
G_k := \nabla_x f(x^k, y^{k+1}) + \lambda (\nabla_x g(x^k, y^{k+1}) - \nabla_x g(x^k, z^{k+1}))
$$

 $\|\nabla \mathcal{L}_{\lambda}^*(x^k) - G_k\|$  can be estimated by

$$
\lambda(\|y^{k+1}-y^*_\lambda(x^k)\|+\|z^{k+1}-y^*(x^k)\|)
$$

To obtain  $\|\nabla \mathcal{L}_{\lambda}^*(x^k) - G_k\| = O(\epsilon)$ , we need  $O(\epsilon/\lambda) = O(\epsilon^2)$  accuracy of  $y^{k+1}$  and  $z^{k+1}$ .

 $T \asymp \epsilon^{-4}$  inner-loop iterations are required to have  $O(\epsilon^2)$  accuracy of  $y^{k+1}$  and  $z^{k+1}$  $z^{k+1}$ [.](#page-31-0)

- $T \asymp \epsilon^{-4}$  inner-loop iterations are required to have  $O(\epsilon^2)$  accuracy of  $y^{k+1}$  and  $z^{k+1}$  $z^{k+1}$ [.](#page-31-0)

# <span id="page-36-0"></span>Stochastic gradient descent

$$
T \approx \epsilon^{-4}
$$
 inner-loop iterations are required to have  $O(\epsilon^2)$  accuracy of  $y^{k+1}$  and  $z^{k+1}$ .

• Let f be a L-smooth and  $\mu$ -strongly convex function for some  $\mu$ ,  $L > 0$ .  $\bullet$   $G(x, \xi)$  is an unbiased stochastic gradient estimator for f:

$$
\mathbb{E}[G(x,\xi)]=\nabla f(x).
$$

• The variance of the gradient estimation error is bounded:

$$
\mathbb{E}[\|G(x,\xi)-\nabla f(x)\|^2]\leq \sigma^2.
$$

#### Lemma

For  $x_{t+1} \leftarrow x_t - \alpha G(x_t, \xi_t)$  and for all  $0 \le t \le T$ ,

$$
\mathbb{E}[\|x^{t}-x^{*}\|^{2}]\leq (1-\mu\alpha)^{t}\|x^{0}-x^{*}\|^{2}+\frac{\alpha\sigma^{2}}{\mu}.
$$

In particular, taking  $\alpha = \frac{8 \log T}{\mu T}$ , we have

$$
\mathbb{E}[\|x^T - x^*\|^2] \le \frac{1}{T^4} \|x^0 - x^*\|^2 + \frac{8 \log T}{\mu^2 T} \sigma^2.
$$

## Lower bound

### Question

Are the convergence rates optimal?

- In (J. Kwon-D. Kwon-Lyu, ICML 2024), we provide the matching  $\epsilon^{-6}$  lower bound on y\*-aware oracles with finite  $r \asymp \epsilon$ .
- $\bullet$  Under the same condition,  $\epsilon^{-6}$  upper bound can be shown.

 $\left\{ \begin{array}{ccc} \square & \rightarrow & \left\{ \bigcap \mathbb{R} \right. \right\} & \left\{ \begin{array}{ccc} \square & \rightarrow & \left\{ \end{array} \right. \right. \right. \end{array}$ 

### Lower bound

#### Definition (y <sup>∗</sup>-Aware Oracle)

An oracle is y\*-aware, if there exists  $r\in (0,\infty]$  such that for every query point  $(x,y)$ , the following conditions hold.

- In addition to stochastic gradients, the oracle also returns  $\hat{y}(x)$  such that  $\|\hat{y}(x) y^*(x)\| \le r/2$
- Gradient estimators satisfy the assumptions only if  $||y y^*(x)|| \le r$ ; otherwise, the returned gradient estimators can be arbitrary.
- If we take  $r = \infty$ , the additional estimator  $\hat{y}(x)$  is uninformative. We recover the usual first-order stochastic gradient oracle.
- $\bullet$  The same upper bound holds for finite  $r$ .

 $298$

- $\bullet$  The same upper bound holds for finite r.

 $298$ 

### Non-convex lower level

# If g is not convex, then  $y^*(x)$  and  $y^*_{\lambda}(x)$  may not be uniquely determined.

- A solution set  $\mathcal{T}(x,\lambda) := \mathsf{arg\,min}_\mathcal{Y} \left(\lambda^{-1} f(x,\mathcal{y}) + g(x,\mathcal{y})\right)$  may not be stable.
- In (J. Kwon-D. Kwon-Wright-Nowak, ICLR 2024), similar convergence results are given under the Lipschitz continuity of T.
